1. Introduction

The Documentation Report of the Austrian National Election Study (AUTNES) Rolling Cross-Section Panel Survey 2013 is a document to accompany and document the data of the AUTNES survey.

This panel study was conducted to investigate period of the electoral campaign and the outcome of the Austrian National Election held on 29 September 2013. The body elected was the National Parliament (Nationalrat).

The Documentation Report is structured in five sections. **Section 2** contains information about the conditions of use of the data. **Section 3** provides some essential information about the study itself. **Section 4** informs about the study design, fieldwork, sampling procedure, weighting and other important aspects of the survey design. Information on questionnaire development is provided in **section 5.** A codebook for open-ended questions and the complete codebooks (full variable list) in German and English can be found in the last section, **section 6**.

How to cite these data:

Data users are kindly asked to acknowledge the data and the accompanying release documents. Please refer to the AUSSDA Dataverse (https://data.aussda.at, doi: 10.11587/2EFFLY) for a recommendation on how to cite these data and the documentation.

Changes in Version 2.0

For an overview of changes between the first version of these data and documentation (AUSSDA version 1.0) and the current AUSSDA version 2.0, please look at the document “10055_readme.pdf”.

2. Conditions of Use

Restrictions

See the AUSSDA Dataverse (https://doi.org/10.11587/2EFFLY) for the Terms of Use of the data.

Confidentiality

AUTNES, the Principal Investigators and the funding institution bear no responsibility for the use of the data, or for interpretations or inferences based on their use, neither do they accept liability for indirect, consequential or incidental damages or losses arising from use of the data.

Deposit Requirement

In order to facilitate exchanges within the scientific community and to provide funding agencies with essential information about use of archival resources users of the AUTNES data are requested to notify the AUTNES team of all forms of publications making use of AUTNES data.

3. Study Description

Title and Edition

AUTNES Rolling Cross-Section Panel Study 2013 – Documentation
(Version 1.1)

Principal Investigators

Wolfgang C. Müller, University of Vienna (Supply Side)
Sylvia Kritzinger, University of Vienna (Demand Side)
Hajo Boomgaarden, University of Vienna (Media Side)

Topics / Keywords

Pre-Election and Post-Election Survey (wave 1 & wave 2)

Issue saliency, issue performance and ownership, evaluation of economic situation and immigration situation, policy issues during campaign (split), party ID, party and candidate sympathy, left-right placement, political cynicism, campaign attention, party-voter campaign contact, turnout/vote (intention), timing of voting decision, political efficacy, voter duty, postal votes, preferential

votes, turnout of others, preference for/likelihood of coalitions (split), candidate characteristics (split), TV debates watched, general media consumption, political knowledge, socio-demographics.

Inter-Election Panel Survey (wave 3)

Political interest, satisfaction with democracy, issue saliency, issue performance and ownership, party sympathy/ID, political efficacy, trust in institutions, recall of vote in last national election (recall experiment, split), political knowledge, evaluation of economic situation, political participation turnout/vote (intention), preference for coalitions, issue importance, satisfaction governmental parties/ opposition parties, satisfaction parties x issues, public spending, social acceptance of political positions/behavior, trust in, socio-demographics.

4. Study Design

Overall Study Design

The initial survey (wave 1) of this component of the Austrian National Election Study (AUTNES) is based on the Rolling Cross-Section (RCS) Design for surveys.[1] The RCS-Design was developed in order to overcome problematic temporal heterogeneity of respondents. In polls with stretched-out fieldwork (such as cross-sectional samples) the day on which a respondent is interviewed is typically not random but depends on the availability of the respondent. Temporal heterogeneity affects causal inferences as those respondents who are interviewed later typically differ from those interviewed earlier. Hence, differences in aggregate opinion could be due to external effects (e.g. campaign effects) or simply due to non-randomized days of interviewing.

RCS tries to overcome this problem by randomizing not only the initial inclusion in the sample, but also by randomizing the day a respondent is interviewed. To achieve this end, RCS uses a more complex interview strategy than cross-sectional designs: First, the initial sample is broken up into several *replicates* (usually for each day of projected interviewing). All respondents of the total sample are distributed randomly into one of the *replicates*; hence, each *replicate* represents the total sample. Second, a given *replicate* remains open for the whole period of interviewing. At each day of interviewing a new *replicate* enters the field and interviewers try to contact all respondents within that *replicate*. If a respondent is not accessible, interviewers contact him/her again at the next day – until they reach him/her or the field-time is over. By entering new respondents every day and re-contacting respondents from older *replicates*, the interviews per day consist of respondents who can be easily reached and those who are harder to interview. At this point, however, the day of interview becomes in fact a random event – and no longer depends on the initial availability of a respondent.

As the day of interview is randomized, RCS designs facilitate detailed exploration of short-term processes of opinion formation and opinion change due to external influences. Researchers are enabled to study the effects of events which are not foreseeable at the time the survey is planned. Hence, RCS is a vital tool for studying election campaigns and their influence on voters' opinions and intentions.

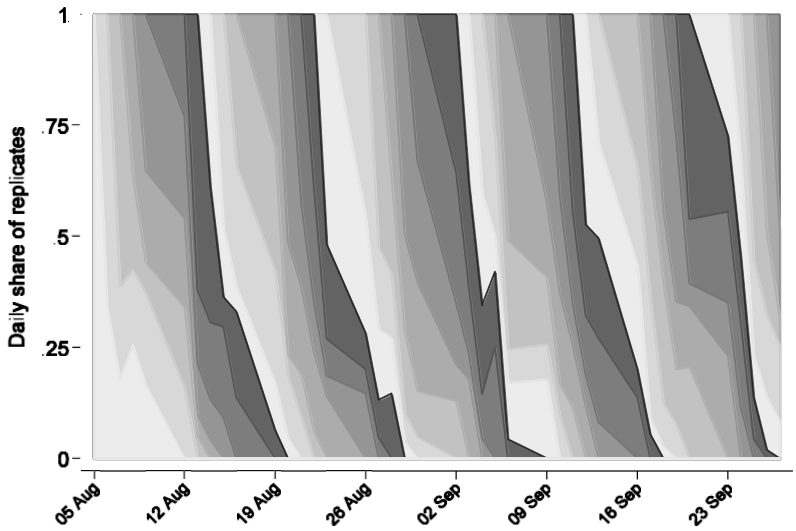
[1] e.g. Johnston, R. & Brady, H. E. (2002) The Rolling Cross-Section Design. *Electoral Studies*, *21*, 283-95.

Sampling Procedure

The survey fieldwork for the RCS Pre-Election Survey (wave 1) was conducted using Computer-Assisted Telephone Interviewing (CATI). Sampling of phone numbers for the CATI interviews is based on a mixture of random digit dialing (RDD, 50%) phone numbers and numbers that are officially registered (telephone book, 50%). The final distribution of landline and cell phone numbers in the RCS Pre-Election Survey was 44.4% and 55.6%, respectively.

For the RCS Pre-Election Survey a pool of n = 11999 random phone numbers (1 duplicate address deleted) was selected to ensure a sufficient number of valid telephone numbers. The phone numbers were randomly assigned to replicates for the RCS design so that a total of n = 300 'fresh' random phone numbers was potentially available for each day of fieldwork. In order to achieve an appropriate mixture of 'easy' and 'hard to reach' respondents the daily share of phone numbers is comprised of new phone numbers and older numbers to be completed, which remained in the pool 7 days at the maximum (see Figure 1).

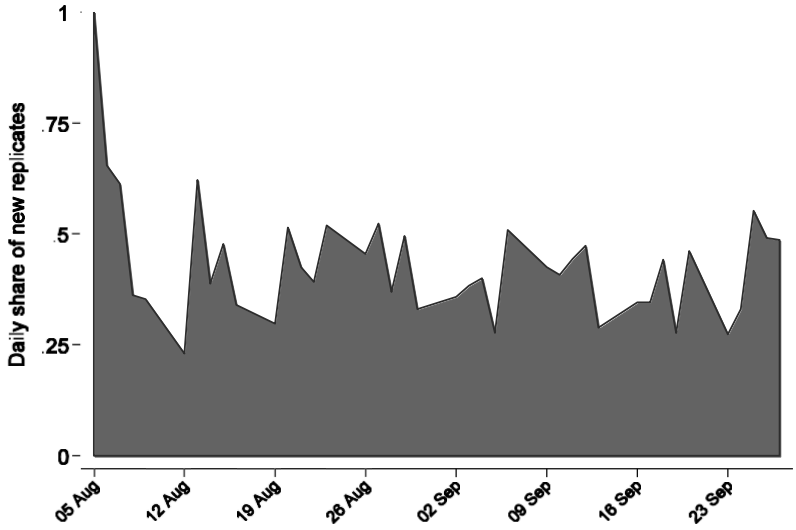
Figure 1: Distribution of fresh and older numbers in the sample



(Note: Each layer represents the share of new phone numbers and the time the numbers remained in the pool)

The daily share of new phone numbers was 43% on average (see Figure 2).

Figure 2: Distribution of new phone numbers per day



Respondents within households were selected using the next-birthday method. Each respondent could also make an appointment to be contacted again. The dataset contains more detailed information on the number of contact attempts (variable i3).

Quality control

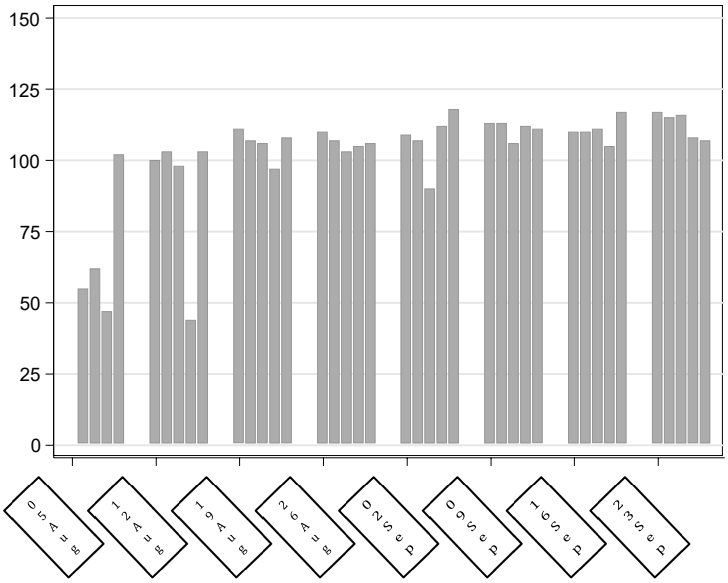
Before and during the fieldwork members of the AUTNES team guided interviewer training.

Fieldwork

<u>2013 RCS Pre-Election Survey (initial survey, wave 1):</u>
Computer-Assisted Telephone Interviews (CATI) were conducted by 40 interviewers in total. The fieldwork ran from 5 August to 27 September, 2013 (8 weeks). However, no interviews were conducted on weekends (Saturdays, Sundays). Hence, fieldwork ended on 27 September, two days before the election on September 29, 2013.
The daily target sample size was set to approximately n = 100 respondents. After the first week the stipulated daily sample size was relatively equal (except on 15 August, a national holiday) (see Figure 3).

The total sample size for the RCS Pre-Election Survey is n = 4011.

Figure 3: Daily sample sizes



2013 RCS Post-Election Panel Survey (panel component, wave 2):
The survey fieldwork was conducted using Computer-Assisted Telephone Interviewing (CATI) by 20 interviewers in total. 79.6% of the panel respondents were re-interviewed by the same interviewer. Fieldwork ran from 1 October to 4 November, 2013.

The total sample size for the RCS Post-Election Panel Survey is n = 2607 (65.0% re-interviewed from Pre-Election sample).

2015 RCS Inter-Election Panel Survey (panel component, wave 3):
The survey fieldwork was again conducted using Computer-Assisted Telephone Interviewing (CATI) by 6 interviewers in total. 62.2% of the panel respondents were re-interviewed by the same interviewer as in wave 2. Fieldwork ran from 14 August to 20 October, 2015 (because of the Viennese regional elections, there was a break between 30 September to 11 October).

The total sample size for the RCS Inter-Election Panel Survey is n = 1223 (30.5% re-interviewed from Pre-Election sample, wave 1).

Response Rate

Table 1: Contact outcomes and response rate for Pre-Election Survey

	Frequency		
Invalid phone number	2467	20.6%	
Housing units with no eligible respondents	105	0.9%	
Interview completed	4011	33.4%	42.5%
Interview breakoff	112	0.9%	1.2%
Non-contact	2625	21.9%	27.8%
Refusal by other persons (household-level refusal)	349	2.9%	3.7%
Target respondent, refusal	2036	17.0%	21.6%
Target respondent identified, never available	130	1.1%	1.4%
Target respondent identified, language problems	56	0.5%	0.6%
Miscellaneous	108	0.9%	1.1%
Total	11999	100.0%	100.0%

The response rate for the 2013 Pre-Election Survey component (wave 1) is 42.5% (AAPOR 7 Standards).

The response rate for the 2013 Post-Election Panel Survey component (wave 2) is 65.0% (n = 2607/4011).

The response rate for the 2015 Inter-Election Panel Survey component (wave 3) is 46.9% (n = 1223/2607).

Weighting

The dataset includes two weighting variables for post-stratification:
(1) For the RCS Pre-Election Survey (wave 1) the variable 'wgtx' can be used for post-stratification adjustment to known population distributions. This post-stratification weight is computed to adjust on a weekly basis (using the sub-samples per week of fieldwork, i.e., weeks 1 to 8) and is combined afterwards.
(2) For the RCS Post-Election Panel Survey (wave 2) the variable 'wgtp' can be used for post-stratification weighting.
(3) For the RCS Inter-Election Panel Survey (wave 3) the variable 'wgtpp' can be used for post-stratification weighting. An additional weight variable called 'wgtppva' further adjusts for turnout and vote choice marginals.

There is no design weight for the sampling scheme used.

Computation of the weighting variables was limited to a maximum value of 4.00 and a minimum value of 0.25. Target distributions are based on Micro Census data 2012 (Statistics Austria StatCube, retrieved Sept. 2013) using the Austrian population aged ≥ 15 having Austrian citizenship as reference population, i.e., a total of 6,325,600 residents. Official election results are provided by the Austrian Ministry of the Interior. The following expected values were used in an iterative weighting procedure (Table 2), using the STATA module ipfweight for computation:

Table 2: Target population distributions

Gender	male	48.6%
	female	51.4%
Age group	aged 15 to 24	14.1%
	aged 25 to 34	14.1%
	aged 35 to 44	16.4%
	aged 45 to 54	19.2%
	aged 55 to 64	14.3%
	aged 65+	21.9%
Formal education	No school, primary school, lower secondary level (incl. Pre-vocational school)	23.8%
	Vocational training, vocational school	37.1%
	Higher vocational school (BMS)	13.6%
	Secondary school leaving certificate (='Matura')	14.5%
	University-related institution, tertiary education	11.0%
Migration background (both parents born abroad)	no	91.4%
	yes	8.6%
Province (=provincial constituency)	Burgenland	3.7%
	Kärnten	7.0%
	Niederösterreich	20.1%
	Oberösterreich	17.2%
	Salzburg	6.1%
	Steiermark	15.3%
	Tirol	8.4%
	Vorarlberg	4.2%
	Wien	18.0%
Household size	1 person	19.3%
	2 persons	29.5%
	3 and more	51.2%
Employment status	working	53.6%
	retired	27.3%
	students, pupils aged 15+	7.2%
	other	11.9%
Age x education	aged 15-44 with Matura	15.0%
	aged 15-44 without Matura	29.6%
	aged 45+ with Matura	10.5%
	aged 45+ without Matura	44.9%
Gender x education	female with Matura	13.2%
	female without Matura	38.2%
	male with Matura	12.3%
	male without Matura	36.3%
Vote*	non-voter (100% minus turnout)	25.1%
	SPÖ	20.1%
	ÖVP	18.0%
	FPÖ	15.4%
	The Greens	9.3%
	NEOS	3.7%
	Team Stronach	4.3%
	other/invalid	4.1%

(Source: Micro Census data 2012, Statistics Austria StatCube, retrieved Sept. 2013; *Only used for weighting by vote choice in 'wgtppva': http://wahl13.bmi.gv.at)

Data cleaning

Postal code information was validated and corrected for wrong entries (note: postal code information is not included in the final data set for reasons of data protection). Based on the postal codes, contextual variables, provincial

constituency and regional constituency were added. These are provided in the full data release (variables lwk_id and rwk_id, respectively).

If applicable, missing values have been assigned the following values throughout the survey:
88 = Don’t know
99 = Refused

5. Questionnaire development (all AUTNES)

Cognitive pre-testing
Once a relatively complete draft had been finalized, we conducted cognitive interviews to pre-test the AUTNES survey questionnaires (June to September 2011). Our aim in using cognitive interviews was to detect possible ambiguities in question interpretation or deficits in scale design. We made use of the 'think-aloud' technique as well as of behavior coding, which aims to capture specific reactions of the respondents to certain questions. In addition, we designed specific 'probings' for certain survey questions or certain terms. In total, we conducted 20 cognitive interviews, each about an hour in length, which were then recorded and transcribed. We recruited interviewees carefully to ensure variation in age, gender, education, and political interest of respondents as well as a regional spread (urban/rural, east/west) within Austria. Respondents were paid 20 Euro as an incentive to participate. As the number of questions to be tested was rather high, we designed two different questionnaires with most of the questions asked only in one questionnaire. We then conducted ten interviews with each questionnaire. The cognitive interviews provided us with many insights that we used to adjust our survey questions. As a whole, these findings have helped us to greatly improve the quality of our instruments.

Quantitative pretest n = 100
Some questions of the questionnaire were tested in a small (n = 100) quantitative pretest in February 2012. Here, we particularly checked for the share of don't know answers or refusals, for variance in distributions, and for the dimensionality of items that were supposed to measure a specific theoretical concept. This again helped to improve the questionnaires.

Pretesting by the field company
Pretests conducted by the field company focused on the length of the interview and burden for respondents, on difficulties that interviewers might have, and on technical aspects such as the application of latency measures. Interviewer instructions were adapted after this procedure.

Language
The survey was conducted in German. We provide both the original German questionnaire and an English translation.

6. Codebooks

Open-Ended Questions: Most Important Issue

There were several open ended questions in the questionnaire. In the data set we provide the original answers as string variables, as well as coded variables.

All questions on issues (most important problem, second most important problem) used a code scheme that was developed for AUTNES and that is used also by the Supply Side and the Media Side. The code scheme has three hierarchical levels (level 1 consists of 16 categories, level 2 comprises 91 categories, level 3 includes over 700 categories). A pre-test (using 300 randomly chosen issues from the AUTNES PRE 2013 data-set coded by two human coders) revealed that level 3 was too fine-grained for our purposes (see Table 3). All questions on issue were thus coded on level 2.

Table 3: Inter-Coder Reliability – Pre-Test

	Same number of codes:	**Same code:**
Level 2:	%-Coincidence = 0.950	Krippendorfs Alpha = 0.752 %- Coincidence = 0.760
Level 3:	%- Coincidence = 0.897	Krippendorfs Alpha = 0.642 %- Coincidence = 0.647
n = 300 (AUTNES PRE 2013), two coders.		

All coding was done by two coders; a codebook listing detailed coding rules was provided. Level 2 of the AUTNES-code schema consists of the 91 categories which are pooled to 16 categories at level 1 (listed in Table 4). Coders tried to match the responses with one of the listed categories. Three additional categories were added: (1) Answers which lacked detailed information were coded as “99999 | not classifiable”; (2) respondents mentioning that no problems prevail in Austria were coded as “99998 | no problem in Austria”; (3) a few respondents gave more than one answer. If all answers could be matched with two categories from level 2, coders used “77777 | multiple answers” and coded the initial answers in additional columns. If all answers fell into the same level 2-category, only one code was assigned.

The inter-coder reliability was repeatedly measured during and at the end of the coding process and yielded a high level of coincidence (Same number of codes: %-Coincidence = 95.8%; same code: %-Coincidence = 88.0%; Krippendorfs Alpha = 0.879 in RCS wave 1). Codes that did not match were reviewed and finally matched by a third coder.

Since the code scheme is hierarchical we provide two variables, in the data set: issues on level 1, and issues on level 2. In case the respondents mentioned more than one issue, level 1 and level 2 are coded as “77777 | multiple answers”. The coded answers are, however, contained in extra variables (w1_q5mx1, w1_q5mx2, w1_q5mx3, w1_q7mx1, w1_q7mx2, w1_q7mx3, and w2_q2mx1, w2_q2mx2, w2_q2mx3, w2_q2mx1). If all extra variables fell into the same category at level 2, the corresponding level 1-category was coded.
