Codebook for the Austrian National Transfer Accounts 2015

The codebook provides a short interpretation and description of the variables in the Austrian NTA data set. All variables with exception of the population data, age and sex are given in Euros per capita. Additionally, non-market production, transfers and consumption is also given in minutes per day.

Most NTA variables require two types of data. *Aggregate values* refer to the total economy quantities derived from National Accounts and related data sources. The *age and gender-specific estimates* are based on a wide range of more detailed data sources.

Abbreviations:

The first letter in the abbreviations indicate the type of variable:

- Y – income
- T – transfer
- C – consumption
- S – saving
- P – production of non-market services

For transfers, consumption and saving the second letter indicates the involved sector:

- G – government
- F – private, market (F for family)
- H – private, non-market (H – for households, since most of these services or for the own consumption of households)

Micro data sources

- Integrated static on wage and income taxes (Statistik Austria, Integrierte Statistik der Lohn und Einkommensteuer), the consumption expenditure survey (Statistik Austria, Konsumerhebung 2014/15), the Eurosystem Household Finance and Consumption Survey (HFCS), the European Union Statistics on Income and Living Conditions (EU-SILC) from Eurostat.

General variables

POP – population number

Population in each age group from 0 to 90. Age 90 includes all persons of age 90 and older.

AGE – age

SEX

0 for total population (men + women), 1 – men, 2 – women.

DATA

Only in wide-format data set. Indicates if a variable belongs to the NTA data or to the NTTA data covering non-market production of households.

Income:

YL - Labour income

Gross-gross income from employment. Includes wages and all type of taxes and contributions paid on wages, including the social contributions paid by the employers.

Aggregate: Compensation of employees (D1)

Distribution to age and gender: Based on the integrated statistic of wage and income taxes.

YS - income from self-employment

Income of non-incorporated enterprises. The income is the remuneration for work done by the owner and the return to the owner as entrepreneur.

Aggregate: Mixed income (B3)

Distribution to age and gender: Estimates are based on the integrated statistic of wage and income taxes.

YA - asset income

Income receivable by the owners of assets. Includes profits and property income such as dividends and interest.

Aggregate: Net operating surplus (B2) of corporations and net property income (D4)

Distribution to age and gender: Eurosystem Household Finance and Consumption Survey.

YR – rental income

Consists mainly of the value of housing services produced for own consumption by owner-occupiers (imputed rent)

Aggregate: Net operating surplus of households (B2)

Distribution to age and gender: EU-SILC, imputed rent and information who in the household is responsible for accommodation (variable HB080 and HB090) and information on rental income from the tax statistic.

Y – total primary income of private sector

Income generated by direct participation in the production process and income receivable by the owners of assets before any payment of taxes and social contributions.

Public transfer contributions

Includes all type of transfers (mainly taxes + social contributions) from the private sectors to the government sector.

Aggregate: Social contributions, taxes on income and wealth, taxes less subsidies on production, other current transfers paid from the private to the public sector. We distinguish by tax source using data on the structure of taxes by economic function. (European Union, 2019: *Taxation Trends in the European Union)*.[1]

[1] The data and report can be downloaded from: https://ec.europa.eu/taxation_customs/business/economic-analysis-taxation/taxation-trends-eu-union/taxation-trends-eu-union_en

TGYL – taxes on labour

All taxes and social contributions on labour (Lohnsteuer, Sozialbeiträge), including social contributions paid by the employer.

Age and gender-specific values: integrated statistic of wage and income taxes

TGYA – taxes paid on capital income of households and corporations

Taxes on asset income of households and corporations.

Age and gender-specific values: HFCS

TGYS – taxes on income of self-employed

Income taxes

Age and gender-specific values: integrated statistic of wage and income taxes

TGC – taxes on consumption

Consumption taxes, in particular value added tax

Age and gender-specific values: consumer expenditure survey 2014/15

TGO – total public transfer contributions

Sum of all transfers from private to public sector (TGYL + TGYA + TGYS + TGC)

YN – net primary income

Net primary income is calculated as primary income less public transfer contributions

YN = Y - TGO

Public transfer benefits in cash

Includes mainly social benefits paid by the public sector to the national population.

Aggregate: Social benefits and other current transfers. Distinction by function according to Eurostat data on government expenditure according to the classification of government expenditure by function (COFOG) and the European system of integrated social protection statistics.

TGSOAIC – Social protection old age

Includes mainly pensions

Distribution to age and gender: integrated statistic of wage and income taxes

TGSDIC – Social protection disability and sickness

Care allowances and sickness benefits (Pflegegeld, Krankengeld)

Distribution to age and gender: integrated statistic of wage and income taxes

TGSFIC – Social protection family and children

Child allowances and benefits, u.a. Familienbeihilfe, Kinderbetreuungsgeld, Wochengeld, Kinderabsetzbetrag

Distribution to age and gender: integrated statistic of wage and income taxes, data on age-specific fertility

TGSUIC – Social protection unemployment

Unemployment benefits (Arbeitslosengeld, Notstandshilfe und andere Beihilfen wie Berufausbildungsbeihilfe)

Distribution to age and gender: integrated statistic of wage and income taxes

TGSXIC – Other

Transfers in the category social protection that could not be classified into above categories

Distribution to age and gender: assigned to population in equal shares

TGXIC – Other

Other transfers in cash, not social protection

Distribution to age and gender: assigned to adult population in equal shares

TGIC – Total public transfer benefits in cash

TGIC = TGSOAIC + TGSDIC + TGSFIC + TGSUIC + TGSXIC + TGXIC

TFB – private transfers from ROW

Private gross-border transfers

Distribution to age and gender: assigned to all adults (adults are all persons older than 15 and not in education or older than 30).

YD – disposable income

Income that is disposable for the purpose of consumption and saving before any intra-household transfers; income after accounting for public transfers

YN + TGIC + TFB

Public transfer benefits in kind / public consumption

All type of public consumption is regarded as transfer to the domestic population.

Aggregate: Individual und collective consumption of the government sector

Distribution to age and gender: wide range of distinct data sources

CGE – public consumption education

Consumption expenditure of the government sector for education purposes, mostly schools

Aggregate: final consumption of the public sector, government expenditure according to the COFOG

Distribution to age and gender: data on enrolment rates by age

CGH – public consumption health

Consumption expenditure of the government sector for health, mostly hospitals and non-stationary health services

Aggregate: final consumption of the public sector, government expenditure according to the COFOG

Distribution to age and gender: integrated statist of wage and income taxes

CGS– social benefits in kind other than health and education

Expenditure on in-kind services in the category social protection.

Distribution to age and gender: according to the age and gender-specific profiles in the corresponding category of cash transfers

CGX– public consumption, collective consumption

Aggregate: final consumption of the public sector, government expenditure according to the COFOG

Distribution to age and gender: integrated statist of wage and income taxes

CG – public transfers in kind /public consumption

Total final consumption of the public sector

CG = CGE + CGH + CGX + CGS

YDA – Adjusted disposable income

Disposable income including public transfers in kind (public consumption)

YDA = YD + CG

Private intra-household transfers

Private transfers within households. Includes in particular the consumption of children financed by the parents and transfers between partners.

Aggregate: No aggregate data on private transfers

Distribution to age and gender: based on a combination of micro data from the consumer expenditure survey and EU-SILC.

TFWI – intra-household transfer benefits

Transfers received from other household members

TFWO – intra-household transfer contributions

Transfers paid to other household members

YDF – final disposable income

Income disposable for the purpose of consumption and saving including intra-household transfers

YDF = YD + TFW

YDFA – adjusted final disposable income

Income disposable for the purpose of consumption and saving including intra-household transfers and public transfers in kind

YDFA = YD + TFW + CG

Private consumption

CF – private consumption

Aggregate: final consumption expenditure of private sector

Distribution to age and gender: B

ased on the consumer expenditure survey 2014/15. Consumption of NPISH sector assigned to all adults in equal shares.

Saving

SF – Net saving

Aggregate: net saving of private sectors

Distribution to age and gender: estimated as residual. Net saving is the difference between consumption and final disposable income

Public sector

The account for the public sector shows, how it uses taxes and social contributions for paying interest on public debt, transfers to the population, transfers to the rest of the world sector and public saving.

YAG – asset income of government sector

Property income. A very important components is interest on public debt, that's why it is negative

Aggregate: Net operating surplus (B2) and net property income (D4)

Distribution to age and gender: Based on the profile of total public transfer contributions.

TGO - public transfers to government

See public transfers

TGI – public transfers to private sectors

See public transfers

TGNF – public transfers to rest of the world sector

Contains all type of transfers from the public sector to the resto of the world, such as membership fees to international organizations, taxes paid to the EU or pensions paid to non-residents.

Aggregate:

Distribution to age and gender: Based on the profile of total public transfer contributions.

CG – public consumption

See public transfers

SG – public saving

National Time Transfer Accounts – non-market work

Non-market work is provided in minutes per day and in Euros. The measurement in monetary units is indicated by the letter M at the end of the variable name.

Non-market production

PHHW / PHHWM – production housework

Production of household services, with cleaning, preparing food, shopping, and doing the laundry as most important components. Includes also care for adults and voluntary work.

PHCC / PHCCM – production childcare

Includes all type of childcare activities.

PH / PHM – non-market production

PH = PHW + PCC

Non-market consumption

CHHW / CHHWM – consumption housework

Consumption of household services. It is assumed that all household members consume the same amount of household services.

CHCC / CHCCM – consumption childcare

Consumption of childcare.

CH / CHM– non-market consumption

CH = CHW + CCC

Non-market transfers

THHWO / THHWOM – transfer contributions housework

Transfer contributions of services produced by household work

THHWI / THHWIM – transfer benefits housework

Transfer benefits of services produced by household work

THCCO / THCCOM - transfer contributions childcare

Childcare provided

THCCI / THCCIM - transfer benefits childcare

Childcare received

THO /THOM – non-market transfer contributions

THI / THIM – non-market transfers received

TH /THM – net non-market transfers

TH = THW + TCC
