Questionnaire

Introductory statement: Thank you for taking time for this interview. As you can also read in the consent form, we conduct this interview for scientific purposes only and will not mention your name nor the institution for which you work in the analysis. Our aim is to gather information on how researchers reuse data and what may help them when reusing data.

1. Introductory question

(a) To begin with, please briefly describe in which scientific discipline you are working and what your main research interests are.

(b) If you work empirically, what material do you analyse? In other words, what type of data do you usually use for your research?

2. Findability:

(a) My first questions on data reuse concerns the findability of data. Please think about a current or past research project for which you consider or have considered reusing existing data. How do you search for data or how did you search for data?

(b) Have you encountered any difficulties or obstacles when searching for data?

(c) Which tools are or would be useful for searching data in your opinion?

3. Reusability:

(a) Please think about a past or current research project: What are important factors you consider prior to reusing someone else's data? How do you decide if the data is reusable or not?[1]

(b) Can you think of anything that may facilitate this decision?

(c) Which legal questions do you consider when deciding on reusing data?

4. Accessibility:

(a) When you think about accessing data, for instance downloading data, have you encountered any difficulties in this regard? Which ones?

(b) Which features or tools do you consider useful when accessing data?

(c) Which legal questions have you encountered when reusing data?

[1] 1Source of questions (unchanged): Renata Gonçalves Curty. *Beyond "Data Thrifting": An Investigation of Factors Influencing Research Data Reuse In the Social Sciences.* PhD thesis, Syracuse University, 2015, p. 211.

5. Interoperability:

(a) Which difficulties have you encountered concerning the format or structure of data? Which features proved helpful? (potential example: you would like to merge datasets)

6. General questions and EOSC

(a) Have you encountered any difficulties in reusing data because of transnational issues, e.g. because data are stored in another country?

(b) Is there anything else you would like to add concerning the reuse of data?

(c) What do you know about EOSC, the European Open Science Cloud?

7. Sociodemographic and closing questions:

(a) At which institution are you based?

(b) At which position do you work for this institution? (Pre-doctoral researcher, post-doctoral researcher, tenured professor)

(c) Thank you very much for your participation. Would you like to be notified once the results are published?
