"Political Participation of Young People in Europe – Development of Indicators for Comparative research in the European Union (EUYOUPART)

Workpackage 8
Deliverable 13: Collection of Field Report on Survey

Contract n°.: HPSE-CT-2002-00123
Project Coordinator: Institute for Social Research and analysis/Vienna, Austria

February 2005

This report is based on work package 7 ("Development of questionnaire and pre-test") of EUYOUPART.

Lead partner for WP8:
France: Fondation Nationale des Sciences Politiques (FNSP)

Scientific and administrative coordination:
Günther Ogris, Sabine Westphal
Institute for Social Research and Analysis (SORA)
Vienna, Austria

Consortium members:
Austria: Institute for Social Research and Analysis (SORA)
Austrian Institute for Youth Research (ÖIJ)
Estonia: Institute of International and Social Studies (IISS)
Finland: Finnish Youth Research Network (FYRN)
France: Fondation Nationale des Sciences Politiques (FNSP)
Germany: German Youth Institute (DJI)
Italy: Fondazione IARD (IARD)
Slovakia: University of St. Cyril and Method in Trnava (UCM)
United Kingdom: University of Birmingham

Field reports were delivered by the field institutes employed by national partners according to quality guidelines that was provided by the coordinator.

Table of contents

1. Measures to achieve comparable data for the survey 8

2. Master Questionnaire: Translation Procedure 9

2.1 Notes for Translators 11

2.2 Country specific changes 12

2.3 Translation Decision Form & Documentation of Difficulties 13

3. Field Report Austria 18

3.1 Basic information about the study 18

3.1.1 Key persons and institutions 18

3.1.2 The collection of data 18

3.2 Fieldwork procedures 18

3.2.1 Interviewers 18

3.2.2 Control operations 19

3.3 Characteristics of the sample 20

3.3.1 Response and non response 20

3.3.2 Representativity 20

3.3.3 Weighting 21

3.4 EUYOUPART Sample Design 22

3.4.1 Target Population 22

3.4.2 Sampling Frame 22

3.4.3 Sampling Design (Stratified three stage probability sampling) 23

3.4.4 Screening 23

3.5 Interview situation 23

3.5.1 Duration of interviews 23

1. Measures to achieve comparable data for the survey

The survey for EUYOUPART was conducted between November 1st and December 15th 2004 in seven partner countries. Great Britain started earlier.
Consortium partners subcontracted field institutes to conduct the survey.
To increase the likelihood of comparable data collection procedures across all countries, we developed guidelines for the field institutes, covering the following issues:

- Sampling (quota sample; n = 1000; sampling criteria, face-to-face)
- Fieldwork time
- Deadlines for data submittal
- Instructions for the format of data submittal (spss-format; 3 data sets; labelling, guidelines)
- Working language (English)
- Table of contents for field reports
- Interviewer instructions.

These instructions were sent out to all partners who had the responsibility to forward them to their field institutes, to update them about procedures and changes in the questionnaire and to ensure the quality of the field reports.

Also, model data sets were disseminated that contained the common English
- variable names
- variable labels
- value labels
- as well as a copy of the master questionnaire, indicating the correct variable name for each question.

By providing these documents, we tried to achieve a maximum of comparable data sets so as to minimize data cleaning needs before merging the data sets.

Furthermore, this report contains:
- the translation procedure,
- all national field reports that the field institutes submitted,
- the weighting procedure..

2. Master Questionnaire: Translation Procedure

We did not encounter many difficulties in the translation of the master questionnaire in each national language.
As the translation procedure we used for the pre-test was efficient, we decided to use the same procedure for the main questionnaire, with some adds.

During our meeting in Bratislava, we agreed on the following main rules, which were a guarantee for providing in each language understandable questionnaires with high quality.

- SORA wrote an English master questionnaire. With the help of the British partner (University of Birmingham – James Sloam), this master questionnaire was adapted to British English.

- James Sloam and Ruth Picker provided some "Notes for translators" remarks in the questionnaire. These notes should have made the translation work easier by explaining items that turned out difficult to understand (cultural/ language differences).

- The translation had to be made by bilingual professional translators who had experience in social researches.

- We recommended partners to employ a translator who was external of the EUYOUPART team

- Each national team had to review and check the questionnaire translation in its own language. SORA had to be informed about all adaptations or translation decisions. Final decisions had to be taken in accordance with SORA.

- All difficulties/ issues/ decisions in the course of translating the questionnaire for the survey and adapting it for each country needed to be documented.

- SORA designed a checklist for translation together with a form that should be used to document translation/adaptation decisions. (See Checklist translation above).

Checklist for Translation

- Please observe that 2 different people need to look at it (your translator; the national adjudicator). This is truly useful to make the translation better, so please observe this rule! (see James' guidelines)
- Please use the "notes for the translators" in the questionnaire – they try to make your job easier by explaining items that turned out difficult to understand (cultural/ language differences)
- There are some notes for the NATIONAL COORDINATORS: for several questions, you need to insert some country-specific information. These are decisions that cannot be made by your translator.
- DIRECTION OF QUESTIONS: Please DOUBLE CHECK carefully for each question if it has the same "direction" as in the English questionnaire (= if you answer with "yes" or "agree strongly" this has the same meaning)!!!!!!! This is a MUST! If we make mistakes here, we make big mistakes when we compare answers!!!!
- Also: Please be extra-careful how you translate the answer scales! (e.g., same scales should always be translated in the same way).
- Please send me an email if you are not sure if you understood what we really meant to measure with an item
- There are some items that refer to national opportunity structures (e.g., workers' council, speaker of the class). You do not have to use a word-by-word (literal) translation. Most likely, it will make more sense to choose the term that conveys the appropriate equivalent in your country.
- Please check your adaptation of the questionnaire (this includes translation, but also the order of the questions & items!!!) carefully and WORD BY WORD. The questionnaire for the main survey has not only been shortened, but many other small details also changed. For this purpose, Sabine sent out a) the final approved questionnaire b) a working version that documents the changes & discussions c) an overview about all changes that were made to the questionnaire.
- For all changes that you make or difficulties you encounter in the course of the questionnaire adaptation, please use the "translation decision form":

2.1 Notes for Translators

Table 1 registers all the "Notes for translators" included in the English master questionaire

Table 1

Question number	Word / term / phrase	Help for translation
Q4	Political event	We mean „political event" as something that just happened or that is about to happen and that you want to learn more about. In German, we translate "event" as "Ereignis" (and not as "Veranstaltung"). The intention of the question is to measure which media youth primarily turns to if they are looking for current political information
Q7	General elections	General = the last parliamentary elections. Please use the term that is commonly used in your country for the parliamentary elections.
Q13_10 Q13_11	Ethical	Please check if "ethical" is understandable for 15-25 year olds – it may need national adaption. E.g., in the UK-version "ethical" will be replaced by the word 'moral' in questions 10) and 11). This is a specific UK translation decision. "Moral" denotes the meaning of the word 'ethical', but is more understandable to young people in the UK.
Q15_1	Students 'council	Students' Council" in English equates with the concept of a „Student Government" in other countries (e.g. Austria). We want to know if the target person was/is involved in any formal body that is elected by students to represent their interests in school. Please choose the appropriate word for your country. As there are no "student councils" in Finland, please use the Finish equivalent.
Q16	Do you have work experience in a steady, paid job?	We need to filter out those people who are currently working in a paid job or who have already work experience in a steady = regular job (workers, employees). People who did only internships or temporary jobs during vacations (students) should be excluded by the translation you select. The main thing is that it is a steady, continuous job that is paid (only in this context does the next question make sense).
Q17_1	Workers 'council	For Finish and Estonian coordinator please insert your national equivalent for workers' council
Q17_3	Staff meeting	We want to know if the target person did participate in meetings that the people working in a company (regardless whether they are employees or workers) organised, because they want to change their working conditions or because they are dissatisfied with something. For the UK, the most understandable term is "union meetings", but these meetings are not necessarily organised with a union. For Austria, a good translation for "staff meeting" would be "Mitarbeiterversammlung". Please distinguish from regular work meetings that are held as part of your tasks or workload!
Q26_4	(INT: please ask the name of region/ county)	For the UK; this would be "English, Scottish or Welsh". For Austria, the interviewer needs to ask the name of the

		region, e.g. a “Salzburger”. The national coordinator needs to clarify this with the field institute!
Q40_5	Education and training	We mean the “formal” type of education (School, university) but also continuing education (courses, workshops etc.) that may not result in a formal degree.
Q45	What is your nationality?	the question used here should be the one traditionally asked in forms regarding people’s ‘citizenship’ e.g. ‘In which country do you hold your citizenship?’. You do not need to translate exactly “nationality” if no one will understand this in your country.
Q49_2	Politics does not deal with things that are important to people like me	Item 2 is trying to convey the meaning that political process does not ‘care about’ important issues for one self.
Q50_16	I don’t need the support of the state to create a good life for myself.	With item 16) we want to measure if young people feel that they can achieve everything on their own; if they think all “support” (this includes all services offered by a state in general; not only welfare benefits but also education opportunities etc) by the state is superfluous. You may need to use the word “government instead of “state – e.g. in the UK, ‘government’ will be used instead of ‘state’, because although it is technically wrong, this is the phrasing used most commonly in the UK.
Q51_3	Country’s Parliament	Item 3 should use the specific name of the national parliament if applicable. E.g. for Austria, this will be “Nationalrat”.

2.2 Country specific changes

For some questions, national coordinators were in charge to make the country specific changes suitable for their country. These changes are registered in Table2

Table 2

Question number	Word / term / phrase	Country specific change
Q7	Were you eligible to vote in the last general elections in ***	INSERT month, year
Q8	Did you vote in the last general elections in ***	INSERT month, year
Q9	Which party did you vote for in the last general elections?	INSERT party list A. Party list A comprises all ‘significant’ parties in the last national election (it is completely up to national partners to judge which parties are significant, but we do not – as a guide – want to include very small parties (i.e. those with less than 1.5% of the vote). NOTE: You can include also very small parties BUT there needs to be a good reason why you want to do this.
Q12	Which party did you vote for in the last European Parliament elections?	INSERT party list B. Party list B comprises all parties that a sizeable number of people voted for in the European Parliament election 2004 (it is completely up to national partners to judge which parties are significant, but we do not – as a guide – want to include very small parties (i.e. those with less than

		1.5% of the vote). NOTE: You can include also very small parties BUT there needs to be a good reason why you want to do this.
Q29	How close or distant do you feel to each of the following political parties? Do you feel very close, close, neither close nor distant, distant or very distant to….(party1)…?	INSERT all the parties from party lists A and B
Q41; Q42; Q43	Education level	INSERT NATIONAL CASMIN SCALE Please add to your Casmin scale the categories "don't know" (Code 77) and "answer refused" (Code 88)
Q52_5	(name of Prime Minister or chancellor) is the (country) Prime Minister (or chancellor).	You need to insert the correct information for your country in the following item
Q52_6	The (name of the principal rightist or conservative party of your country) is a leftist political party.	You need to insert the correct information for your country in the following item
Q52_7 Q52_8	In (country), national elections must be held every (correct number of) years.	You need to insert the correct information for your country in the following item
	The (Prime Minister or chancellor) has the right to dissolve parliament.	You need to insert the correct information for your country in the following item

2.3 Translation Decision Form & Documentation of Difficulties

Word/ term/phrase amended		Question Number	Reason for Amendment	Name of Translator(s)/ Reviewer(s)
ESTONIA				
English→Russian	**English→Estonian**			English → Russian Klara Hallik;
General election → Riigikogu election	General election → Riigikogu election	Q7, Q8, Q9	Riigikogu is the name for the Estonian parliament	
cast invalid vote → I defected voting ballot	cast invalid vote → invalid voting ballot	Q9, Q12, Q13_2	Translator's suggestion	
Party → party	Party → erakond (partei)	Q9, Q12, Q18_5, Q24	Erakond is Estonian word for 'political party'	English → Estonian Gerli Nimmerfeldt;
Ethical → moral	Ethical → ethical	Q13_10, Q13_11	Translator's suggestion	
Legal demonstration → officially allowed demonstration	Legal demonstration → officially allowed demonstration	Q13_14	Translator's suggestion	Reviewer Marti Taru;
Illegal demonstration → officially not allowed demonstration	illegal demonstration → officially not allowed demonstration	Q13_15	Translator's suggestion	Survey company Faktum made also some translation suggestion
Demonstration → demonstration	Demonstration → 'meeleavaldus'	Q13_14, Q13_15, Q21, Q24_7	'meeleavaldus' is common Estonian word for 'demonstration'	
Political action → political event	Political action → political action	Q13_21, Q13_22	Translator's suggestion	

Word/ term/phrase amended		Question Number	Reason for Amendment	Name of Translator(s)/ Reviewer(s)
Workers' council → workers' (trade union) council	Workers' council → workers' council	Q17_1, Q17_2	Translator's suggestion	
Does not hold strong opinion → I do not hold strong opinion	Does not hold strong opinion → Does not hold OR I do not hold strong opinion	Q19	Translator's suggestion Wording in Estonian can be understood either 'Does not hold' or 'I do not hold'	
Vote in elections → participate in elections	Vote in elections → vote in elections	Q23	Translator's suggestion	
Racism/xenophobia → ignoring and turning back to foreigners	Racism/xenophobia → ignoring and turning back to foreigners	Q31_4	Both racism and xenophobia (esp. the latter) are foreign words that might be incomprehensible to many young people; therefore they were replaced.	
Reduction of welfare state → reduction in welfare level provided/guaranteed by the state	Reduction of welfare state → reduction in welfare level provided/guaranteed by the state	Q31_5	There is no good translation for the term 'welfare state' either in Estonian or in Russian so it was translated indirectly	
In community or military service → in military or alternative service	In community or military service → in military or alternative service	Q38	There is no community service in Estonia. There is an opportunity for alternative service in civil rescue units.	
There is too many immigrants → in Estonia there is too many immigrants: people who moved here during last decade	There is too many immigrants → in Estonia there is too many immigrants: people who moved here during last decade	Q50_6	The same logic as in q31_3 (see below, Table of translation difficulties)	
The (Prime Minister or chancellor) has the right to dissolve parliament → Estonian Prime minister has the right to dissolve Riigikogu	The (Prime Minister or chancellor) has the right to dissolve parliament → Estonian Prime minister has the right to dissolve Riigikogu	Q52_8	The original item would appear incomprehensible for at least 2 reasons 1 respondents are more likely to know facts about own (Estonian) political system; no-one knows facts about different political systems 2 political systems are different in terms of relationships between major political institutions	

Word/ term/phrase amended	Question Number	Reason for Amendment	Name of Translator(s)/ Reviewer(s)
The word 'immigrant' has probably acquired meaning that is different from that in Western European countries. Consequently, data across the variable would be not comparable fully. The reason is that Russian minority – people who moved here some 20 or 30 years ago – are often referred to as immigrants so that the word 'immigrant' has acquired a specific meaning. The number of people who move into the country nowadays is so small that the word 'immigrant' is not understood as referring to them. The word 'naturalisation' has acquired meaning referring to people who acquire citizenship nowadays. This process mainly involves people who live here many years and have now passed citizenship exams. In order to distinguish between long-term inhabitants, who are often referred to as 'immigrants' from people who move into the country from abroad nowadays, the meaning of 'immigrant' was specified. It was specified so as to correspond to the situation in Western European countries where the immigration problem is associated with people moving in right now. For this reason, 'immigration' was specified so as to refer to current immigrants and not to people who were moved in some 30 years ago as labour.	Q31_3	Number of immigrants → too many immigrants: people who move here from abroad	
In the list of political parties only political parties appeared… The problem was that in Estonia also single persons could stand for election into national or European parliament. Such 'non-party' individuals actually received thousands of votes (2004 EP elections 13168 votes=5,7%; 2003 Parliamentary elections 2161 votes=0,4%) . so that it would be unjustified to leave them out from the list of candidates.	Q9, Q12	Added category 'single candidate' to the list of political parties; code 7	
FINLAND			
Speaker	Q15_2	Formal speakers do not exist in Finnish schools. Should not be used in comparative analysis. The Finnish translation refers to being active in speaking on behalf of other students.	Mika Kiiski
Workers'council	Q17_1	This does not exist in Finland. The term has been replaced by several similarish institutions that cover differing types of workers' representation. Should not be used in comparative analysis.	
Overlap	Q28_5 Q28_10	It can be assumed that respondents fail to understand the slight difference between these statements and just complain about asking the same thing twice	

Word/ term/phrase amended	Question Number	Reason for Amendment	Name of Translator(s)/ Reviewer(s)
Reduction of welfare State	Q31_5	Direct translation would lead to very clumsy language. It has now been translated as "Weakening of public welfare services" which appears to be close to the original's intent.	
Definition or “finishing”	Q40	At least in Finland one can "study" even if one hasn't actually studied for years. To overcome this problem some other international surveys use "At what age did you finish full time education?". This is the wording I have used here. If you find this inappropriate, please define what you mean by the question so that the wording can be modified accordingly.	
Definition of “school”	Q40	Please define. Text may have to be modified.	
Some / severe	Q50_1	Pretest talks about "some", this has apparently been changed at some point - are there other similar undocumented changes?	
FRANCE			
Locals politics → au niveau local National politics → au niveau national European politics → au niveau européen International politics → au niveau internationale	Q2	We decided to add ”local level”, national level” etc… “au niveau local”, “au niveau national”. It makes more sense in French.	Cécile RIOU Anne MUXEL
Students’ council → conseil d’administration de l’école	Q15	We try to find the exact correspondence for students’ council in France	
Do you have a work experience in a steady, paid job? → un emploi rémunéré et stable	Q16	We try to translate “steady” in the way suggested by the “note for translator	
Participated in elections for a workers` counc → Voté aux élections syndicales (prud’hommes, instances représentatives des salariés…)	Q17_1	We explained the expression « workers’council » by giving some concrete examples	
Reduction of welfare Sate →la diminution des aides sociales de l’Etat	Q31_5	Welfare State does not make sense in French common language	
GERMANY			
“Unterschriftensammlung” instead of “Petition”	Q13_6	Petition is too “technical”	fw/Johann de Rijke/Wolfgang Gaiser
“Unterschriftensammlung” instead of “Petition”	Q24_8	Petition is too “technical”	
ITALY			
Worn a badge with a political message.	Q13_13	We translate wih the more generic terms “oggetto” (object). It was the more neutral translation we could do.	Chiara Degano/Gloria Cornolti
Item: “sports club”	Q18_17	In Italy there are differences between sport clubs and sport associations. Especially speaking about soccer, the sports clubs are famous as the soccer supporter clubs. That’s way we decide to translate with the more generic phrase “associazioni sportive”.	

Word/ term/phrase amended	Question Number	Reason for Amendment	Name of Translator(s)/ Reviewer(s)
Item: “a town or a small city”	Q48	We translated with “città di provincia”. In Italy all towns except for the big capital of region are “città di provincia”. They usually are small city.	
Item 14,15 “legal/illegal demonstration	Q13	We preferred translate with “authorized=autorizzate or not authorized=non autorizzate” because in Italy the terms legal/illegal is too strong.	
SLOVAKIA			
Local and regional	Q2	Local in Slovak language is not regional and we need also level of regional	Machacek Ladislav
International and world	Q2	For our respondent is not the same	
Employment board and trade union	Q19	In some working place are trade union but not employment board, People don’t understand in some cases what is it.	
Boycott	Q27	We focus we put in to bracket don’t buy	

NB : About Q40:
We realised that this question had a different meaning in the partner countries, and its use for comparative analysis would be restricted (we thought there was already a misunderstanding when discussing the wording of this question with the partners; in German, “in school” means exclusively that you are a pupil and are at maximum trying to get the high school diploma. Whereas we realised that in the French, Italian and English translation the university studies/students are also included).

We avoided the international phrasing “at which age did you finish your full time education?” on purpose (at least the German & Austrian team was talking about the same idea, namely to ask exclusively about school students) – but we realised that we ended up with a mixture of translations (some included university students, others did not).

Conclusion:
We could not arrive at one common & comparable translation for Q40 across all 8 countries anyway
Therefore, our suggestion was that partner either

- went with the Austrian/ German solution and translated “school” as “school” (chose a translation that makes clear that we are not asking about university studies)
- went with the UK/French/ Italian solution and translated “school” as “Studies” (= education in the broader sense, this solution included university studies)

3.1.2 The collection of data

Date of collection
Field work period. 15/11/04 – 15/12/04

Mode of data collection
Paper and pencil interview; Data keyed from questionnaire

Language
German

3.2 Fieldwork procedures

3.2.1 Interviewers

Interviewer selection:
Total number of interviewers: 123
Number of experienced interviewers: 37
Number of inexperienced interviewers: 86
Gender: 34 male and 89 female interviewers
Age: 62 up to 30 years old, 61 over 30 years
Interest in politics: 25 very interested, 69 fairly interested, 39 not very interested

Briefing of interviewers
Number of EUYOUPART specific personal briefings per interviewer: 1
Total length of the personal briefing per interviewer: ½ hour
Number of interviewers who received EUYOUPART specific personal briefing: 123

As part of EUYOUPART specific personal briefing, Interviewers were trained in refusal conversion
During field work, a Help Desk was permanent available for the interviewers
No written EUYOUPART specific instructions for the interviewers

Payment of interviewers
Per completed interview

Call schedules, visits
Number of minimum required personal visits per respondent: 1

Call schedules, telephone (Screening)
Number of minimum required calls per respondent: 3
Number of calls (per respondent) required to be on a weekend: 1
Number of calls (per respondent) required to be in the evening: 1

Distribution of contacts

	Contacts	%
1	5524	47,0
2	3545	30,2
3	1941	16,5
4	456	3,9
5	188	1,6
6	38	,3
7	30	,3
8	16	,1
9	12	,1
10	4	,0
	11754	100,0

No use of advance letter or brochure

No use of respondent incentives

Strategies for refusal conversion
Second contact (either by regional interviewers or by the field institute)

3.2.2 Control operations

Number of sample units selected for quality back-checks: 123 (one per interviewer)
Number of realised interviews: 45

Outcome of attempted back-checks
Outcome from fieldwork confirmed Back-checks: 45

Type of control back-checks:
Telephone

Checking of data
Consistency checks
Logical consistency: data were checked for logical coherence
Structural consistency: data were checked for the correct use of filter instructions

3.3 Characteristics of the sample

3.3.1 Response and non response

Result of last contact	(n)	%
1 complete interview	1007	8,6
2 incomplete interview	43	,4
3 Address not usable	834	7,1
4 target person not determined	2598	22,1
5 no target person in household	6262	53,3
6 target person not available	146	1,2
7 interview refused by target person	621	5,3
8 interview refused by other person	243	2,1
	11754	100,0

3.3.2 Representativity

Source: MZ 2002/4

3.4 EUYOUPART Sample Design

3.4.1 Target Population

15 to 25 year old persons who are resident within private households in Austria, regardless of nationality and citizenship. Homeless, institutional populations and people not understanding German language are excluded.

3.4.2 Sampling Frame

For Stratification: Census 2001 and MZ 2002/4. For selection of households: Austrian Telephone-Book (CD), which is updated four times a year. Assumption: Nearly all member of the target population are listed in the Austrian Telephone-Book-CD.

3.4.3 Sampling Design (Stratified three stage probability sampling)

Regional Stratification: 47 strata (8 federal countries ("Bundesländer") x 3 categories of population size of municipalities (small: < 2500, medium: < 10.000, large: ≥ 10.000) plus 23 districts of Vienna).

1. Stage: Primary Sampling Units are 122 municipalities (including 23 districts of Vienna). The selection within a stratum is done by systematic proportional-to-size random sampling.

2. Stage: Within the 122 municipalities households were drawn by simple random sampling from the Austrian Telephone-Book-CD. The number of selected households equals the relative size of the population in the municipality multiplied by the factor 12. This factor represents the fact that in approximately every 12th household a member of the target population can be found.

3. Stage: Within all households the target persons are randomly drawn with the Next-birthday-Method.

3.4.4 Screening

A total number of 11.754 households were contacted by telephone in order do determine, whether there lives a target person or not.

3.5 Interview situation

3.5.1 Duration of interviews

Mean=39 minutes, median=38 minutes (min=23, max=95)

3.5.2 Interference of other Persons during interview

In 9 % of the interviews third persons were present who interfered.

3.6 Difficulties during fieldwork/deviations from planned procedures

None

4. Field Report Estonia

4.1 Basic information about the survey

Name of study	**Political Participation of Young People in Europe – Development of Indicators for Comparative Research in the European Union (EUYOUPART)**
Field institute	**OÜ Uuringukeskus Faktum** Pärnu mnt. 23 10141 Tallinn ESTONIA +372 668 4530 faktum@faktum.ee
Contact	Veiko Vaade veiko.vaade@faktum.ee Auni Tamm auni.tamm@faktum.ee

4.2 Sample Description

From 2 to 21 November 2004 research centre Faktum carried out a study among young people aged 15 to 25. The study, commissioned by RASI, investigated the socio-political attitudes of the youth of Estonia.

The universe of the study comprises permanent residents of the Republic of Estonia aged 15 to 25, a total of 223,769 people (ESA, 01.01.2003.a.).

The planned sample size was 1000 respondents.
The sample was formed by using a proportional model of the universe, broken down by regions and settlement types (urban/rural), and multi-stage random sampling.

Multi-stage random sampling was preferred because the principles of the sampling method are comprehensible and familiar to interviewers, and the method ensures that respondents are selected according to the rules of random sampling rather than by choice of the interviewer or the respondent.
The principles of sampling were approved by the Client prior to the study.

First, sampling points were selected on the basis of the model. The sampling points (to the starting address level) were selected on the basis of proportional probability of a settlement (number of inhabitants). The selection was made form the address directory of the Population Register. Then the respondents were selected.

The respondents were selected by starting address method and the so-called “young male rule”. Unlike usually, the interviewers did not have to visit the addresses on their route where no young people lived to their knowledge (in particular in rural areas).
The interviewing method used was face-to-face in-home interviews. The average duration of interviews was 39 minutes. The shortest interview lasted 15 minutes and the maximum length of interview was 95 minutes.

The division of respondents on the basis of various background variables is given in the table below.

Overview chart on structure of sample

Unweighted data		**Distribution**		**Population**	
		n	%	N	%
Total		997	100	223 769	100
Gender	Female	502	50.4	109 670	49.0
	Male	495	49.6	114 099	51.0

Age x gender	Women 15 to 17	192	19.3	31 168	13.9
	Men 15 to 17	210	21.1	32 686	14.6
	Women 18 to 25	310	31.1	78 502	35.1
	Men 18 to 25	285	28.6	81 413	36.4
TOTAL		997	100	223 769	100
Educational level	Incomplete elementary, elementary	570	57.5	116 657	52.1
	Intermediate, general maturity, full vocational maturity	379	38.2	98 927	44.2
	Tertiary	42	4.2	8 185	3.7
TOTAL		991	100	223 769	100
Occupational status	In paid work	213	21.4		
	In education	698	70.0		
	Doing housework, looking after children	41	4.1		
	unemployed	37	3.7		
	other	8	0.8		
TOTAL		997	100		
Living area	Rural area	288	28.9	66 354	29.7
	Town or small city	190	19.1	43 811	19.6
	Urban area	519	52.1	113 604	50.8
TOTAL		997	100	223 769	100

The total number of visited addresses was 6865. The response rate among these addresses was 80.0 per cent. Percentage of realized interviews of all selected addresses was 14.5 per cent. Completion rate (the proportion of contacted selected respondents who successfully complete an interview) was 82.9.

4.3 Field Design

The fieldwork was carried out from 2 to 21 November 2004.

The interviews were carried out by 71 interviewers of Faktum who had received special training and written guidelines for sampling and interviewing. After examining the questionnaire and in the course of fieldwork, the interviewers had an opportunity to ask additional questions in order to receive instructions on specifying problematic questions. Written guidelines given to the interviewers were following

Project "NOORED2"

Interviewing and respondent selection must comply with following rules.

Method: interviewing (interviewer asks verbally questions from questionnaire and marks the answers given by respondent to the questionnaire. Interviewer shows one card with answers at a time according to the instructions written in questionnaire. NB! Questionnaire must not be given to the respondent!)

Respondent selection The respondents are selected by starting address method and the "young male rule".

Starting Address / Address person

(**Starting Addresses** are taken from Population Registry address list by random selection)

Starting address method: Route must be started from the given starting address/address person.

Route continues:

- in cities, boroughs, hamlets following the direction of increasing building and apartment numbers, visiting in sequence all apartments, where live people aged 15-25. At the end of street continue with crossing street or nearest crossing street. Continue route according to start address on the direction of increasing building and apartment numbers.
- in rural areas towards nearest house/farm, visiting in sequence all houses/farms regardless of which side of road houses/farms are situated. On the crossing of roads continue towards nearest house/farm. In the case of apartment house, every apartment of house must be visited.

NB! Information about existence of young people can be asked from neighbor. It is not required to visit apartments where live only the older people.

Young male rule:

- interview will be made with the youngest male person amongst persons who are at home, live at given address permanently and are 15-25 years old

If there are no males at home or there are no permanently living males at given address, then:

- interview will be made with the youngest female person amongst persons who are at home, live at given address permanently and are 15-25 years old

In case person chosen refuses continue the route. Do not make second selection on the given address. If there is nobody home or family members who belong to the target group are not at home, contact the given address at least once more. There can be made only one interview per household. Route will be continued until there will be made 10 interviews!

Visiting time: On working days after 17.00 and on non-working days at proper time during the day.

If respondent do not have time during the first contact, it is allowed to make a visit on any time proposed by respondent.

The division of interviewers by gender and age is given in the table below.

Interviewers by gender and age

	Gender	
Age	Female	Male
20-29 years	3	
30-39 years	5	
40-49 years	22	3
50-59 years	14	5
Over 60 years	16	3

In order to have an overview of the course of the fieldwork and to monitor the interviewing, the interviewers filled out a route form keeping a tally of visited addresses, number of interviews, reasons for not conducting an interview, repeated visits, etc.

The planned sample size was 1000 respondents. The sample was divided into 100 sample points.

4.4 Quality Control

There were sent 150 feedback letters to the respondents to ensure the fieldwork quality. Feedback questions contained information about date and time of the visit, questions about respondent selection, whether interview was conducted as instructed etc.

The quality of interviewing was also checked on the basis of route forms, interviewing protocols and completed questionnaires.
The following table provides a summary of the fieldwork.

Technical report

	Visit number					
Result	**1.**	**2.**	**3.**	**4.**	**5.**	**Total**
1. Interview was completed	709	224	58	4	1	997
2. Incomplete interview	2					2
3. Address not usable	178					178
4. No contact	1063	447	85	1	1	685
5. No people in the target group	4283	194	16	1		4496
6. The representative of the target group was not at home	311	130	32	2		126
7. Refusal in the target group	161	41	11			203
8. Refusal from contact	158	17	3			178
TOTAL VISITED ADDRESSES	6865	1053	205	8	2	6865

Data entry was done with date entry program developed by Faktum. Data entry program allowed to use filters and to check whether the entered value is allowed for field. Non-

marked questions, unrecognisable answers and multiple answers for a single-answer question were inserted as “missing values” and had additional checking afterwards.

The entered data were checked for logical inconsistencies by using various checking methods.

4.5 Difficulties during Fieldwork

- There were difficulties to interview some persons who had no interest in politics. Most of the questions seemed alike for them and they got bored in much less time than others.
- The interview was sometimes too long for respondent.
- There were difficulties to have interviewed the older people of this target group. The older age group seems to spend a lot more time outside of home than younger age group.

5.2 Sample Description

Target population
Men and women aged 15-25, nationally representative excluding Åland Islands.

Sampling strategy and design
Sampling strategy was similar to the one used in the pretest, with the exception of respondent selection. As was agreed with our National Coordinator Kari Paakkunainen, TNS Gallup's standard sampling strategy, stratified cluster sampling was used.

The basic cluster unit was a municipality (444 in total).

Municipalities are divided along three dimensions: Firstly municipalities are divided into 17 regional units, then inside those regions municipalities are classified along official Statistics Finland's urban/semi-urban/rural division. Finally inside those divisions municipalities are ranked in accordance to their representativity of their region and municipality type. There are four representativity classes.

The number of sampling points for each region and municipality type depends on their relative population size.

Actual sampling points were drawn as follows. Only municipalities that belong to the two highest representativity classes were included at this stage. Inside each region and municipality type remaining municipalities were listed and then as many municipalities were randomly drawn as there are sampling points for a particular region/municipality type.

Additionally the largest city in each region was included and a representative (in terms of population) number of sampling points were in any case drawn for those cities.
Finally from the chosen municipalities a starting point(s) for random route were randomly drawn. An up to date street listing (from Finnish Post) was used for this. Starting address information was passed on to the interviewer who followed a systematic random route from this address onwards until he/she reached 8 interviews from the target group. Quotas were not used this time.

Effective sample size
1008 complete interviews.

Type of interviews
Face-to-face ad hoc; pen and paper; optical data entry.

Duration of interviews
Information is not available since this question was not included in questionnaire. However, according to our internal pilot interviews the duration was approximately 35 minutes.

Structure of sample
Please refer to Appendix 1 (Comparison of Sample and Population).

Response rate
Percentage of interviews realized out of all selected addresses: 6%
Percentage of interviews realized out of all selected addresses with target person: 37%

5.3 Field Design

Number of Interviewers
70

Age and gender of interviewers
Female: 67%
Male: 33 %
Average age: 44

Number of sampling points
129

Fieldwork dates
3.11.2004 – 15.12.2004

Organization of fieldwork
Fieldwork as such was implemented by TNS Gallup's internal fieldwork unit. Interviews were conducted by trained in-house interviewers with experience with demanding projects covering social/political topics.

Actual fieldwork was organized, run, controlled and checked by staff located at Espoo central offices. Interviewers worked independently in or near their respective home municipalities. Office staff was readily available to the interviewers in case of difficulty.

Project manager discussed the main points of the project with fieldwork managers. In case there were unclear questions raised by interviewers, project manager was consulted. Interviewers could call directly to project manager, too. It must be said that there were quite few issues during the fieldwork. This can be credited to the adjustments that were done by the central team after the pilot phase.

Fieldwork process:

1. TNS Gallup received confirmation of the project
2. Details were agreed with national coordinator
3. Fieldwork resources were booked from internal FW unit
4. Pilot phase was implemented
5. Confirmation of final fieldwork period and questionnaire
6. Sampling points were drawn
7. Requisite number of interviewers were informed about the project schedule and details
8. Interview materials were prepared
9. Materials were mailed to the interviewers
10. Interviewers acquainted themselves with the materials
11. FW unit's project manager briefed interviewers by telephone about the main points of the project; interviewers asked about unclear points
12. Interviewers started interviews
13. Interviewers asked about unclear points if necessary
14. Staff called to interviewers to check that interviews were proceeding as planned
15. Completed questionnaires and control sheets were mailed to central offices
16. Questionnaires were checked by staff
17. Questionnaires were scanned and scan-data was checked
18. Data was prepared and checked
19. Data was sent to national coordinator
20. Interviewing quality control by CATI interviews

Interviewer briefing
Briefing procedure again is nearly similar to the one used with pilot phase even if the simplification of the questionnaire reduced the number of emphasized issues.

In-depth interviewing instructions were devised by project manager and sent to the interviewers with the rest of the materials. Instructions covered basic information about the project, sampling information, instructions for random route, schedule, general and question-specific information about the questionnaire, note about the quality control and contact information. The importance of informing about difficulties was specially stressed.

After interviewers had acquainted themselves with the materials, project manager called to each interviewer and checked that most important issues were clear with each interviewer. Interviewers naturally had a chance to ask about points that were unclear to them.

Finally, office staff was always available for the interviewers to ask for further advice. Therefore all issues that rose during the interviews could be cleared immediately.

Random route instructions
Interviewers were instructed to start from the exact address that was specified in the control sheet. If the address was a apartment building, interviewers were instructed to start from staircase A and start from apartment number one.

In case nobody was at home, interviewers were instructed to come back in another time and, if necessary, day. If a contact was made with household but the target group member was not available, target person's phone number or certain meeting time was asked in order to arrange the interview. If such contact information was not given, interviewer was instructed to continue random route.

Interviewers were instructed to go towards higher street numbers. If the street ended with T-intersection or fork, interviewers were instructed to always turn to right. It was strongly emphasized that all households had to be contacted on the random route. The second emphasized point was the importance to be systematic leaving as little as possible to the choice of the interviewer.

5.4 Quality Control

Measures to ensure high quality in interviewing
The basis for ensuring good quality data collection is building upon our institute's nearly 50 year long experience with conducting survey research. As the leading research institute in Finland we have developed trustworthy

organization and standards that fulfill the needs of diverse clientele for reliable and valid data. Our data collection process has also been awarded the ISO 9001 certificate.

Without good, professional interviewers it is impossible to collect quality data. Therefore new interviewers are always trained thoroughly and interviewers with longer experience are given regular further training in special training sessions organized in regional interviewing centers.

Specific projects are instructed with in-depth written instructions and briefing given by telephone. But more importantly the interviewers are never left alone – they can always get advice when they are on the field.

Interviewers also know that their work is continually controlled and that cases of misconduct are promptly dealt with. Firstly, all questionnaires are checked by experienced staff that looks for incomplete information but also for telltale signs for any inconsistencies in interviewing work. If problems are noted, they are dealt with accordingly – if the interviewer has made a mistake, he/she is immediately contacted to ensure that the mistake is not repeated.

Secondly, information about all interviewees is recorded on a contact sheet. The sheet includes name, address, telephone number and interviewing date/time. The contact protocol sheet was evaluated within this context. All in all, no interview is approved unless there is requisite information about it.

Finally, at least 10 % of all face-to-face interviews are controlled with CATI-interviews or mail-in questionnaires (in case there is no phone number). The sample is based on contact sheet information and is randomly drawn from the sheets. Control interviews use a set of questions to check weather the interview was conducted as specified. Furthermore, feedback information about the interviewers' work is asked for and reported to interviewers. If especially bad feedback is given, measures are taken to correct the situation.

TNS Gallup's standard sampling is based on a sampling design that was created in cooperation with University of Tampere's Professor of Statistics, Pentti Manninen. Furthermore, doctor Manninen is available to us in specific sampling questions. Sampling procedures are strictly followed and controlled to ensure representativity of the sample.

To ensure that questionnaires do not include inherent problems that appear in interviewing situation, questionnaires are tested by experienced interviewers prior to sending the questionnaires to the printing house. This was done in this case, too, even if the pilot phase had anteceded final data collection phase.

Data quality assurance measures
Data quality was checked in three phases.

Firstly, experienced staff members check completed questionnaires to check weather there is any incomplete information on the questionnaires. If such information is found, respondents are contacted by phone to complete the particular section. Logicality of answers is also checked in some key points of the questionnaire. If there are problems, interviewers are given further instructions.

Secondly, to avoid human errors data is read optically with a reliable scanning system (by Pulse Train Technologies). The scanned data is furthermore edited by staff. The system is intuitive since the scanning software shows the actual scanned image of each question that the system is not sure of and the staff member makes the final decision about the answer. If necessary the information is completed by calling to the respondent.

Thirdly, data is cleaned and checked for inconsistencies. This was done manually and few apparent illogical demographic cases were corrected by contacting respondents. However, some (few) cases could not confirmed and thereby those were left in the data. The actual answers were not touched as there is no certain correction method as individuals are sometimes illogical in their thinking (from the common point of view, that is). Additionally, certain demographic frequencies were checked for consistency.

Contact protocols

Please find the example of used contact protocol sheet in Appendix 2.

Please find contact frequency table in Appendix 3.

5.5 Interview situation

Readiness to be interviewed
According to interviewer feedback the attitude towards participating differed between individuals even more than is the case with older people. Some were enthusiastic to participate and some did not find the topic even a bit interesting. However it would appear that – on balance – the reception was more positive than negative.

Interference of other persons during interviews
There is no certain information available on this. However, general information about the number of additional persons present during interview is available from some other studies. According to these figures it can be assumed that in approximately 2/3 of the cases interviewer and

respondent were not accompanied by anyone else. In the rest of the cases some interference is possible.

5. 6 Difficulties during fieldwork / deviations from planned procedures

General known difficulties and challenges
The target group as such was a challenge. Young people are relatively rare and they are rarely at home. Furthermore the topic of the interview was not the most interesting for this age group – at least in general.

However, it can be assumed that this is the case in most other European countries, too.

As the penetration of mobile phones is close to 100% within this age group, it would be advisable to consider conducting these types of studies by CATI in the future. At least in Finland representative, age-targeted addresses can be bought from Population Register Center and those addresses can be connected with mobile telephone numbers. This obviously would necessitate limiting and simplifying the questionnaire.

Interviewer feedback
In general it appeared that the questionnaire was liked by both interviewers and respondents, although there are some opposing comments. The biggest problems were with Q20 where it seems that many respondents had difficulties in making distinction between left and right. This was especially true when respondents were asked to assess other people's situation.

Below you can read all of the translated and minimally edited comments given by our interviewers:

- Rather clear questionnaire although sometimes the language was a bit clumsy. Some of the youngsters had no idea what "political left" and "right" means.
- Questions were in general OK. Some of the respondents said they don't know the difference between left and right. Additionally, assessing someone else's future prospects was found difficult. Still, there were few DKs.
- Interesting questions for me as interviewer. Q31.3 appeared ambiguous and racist which caused some problems with two respondents.
- Everyone did not know what globalization and left/right mean.
- Questions were well conceived and clear. Respondents however found the questionnaire very long.
- Quite informative and good questions, easy to understand. A bit too long questionnaire, though. Younger respondents did not know about left/right.

- One of the respondents even said that they liked the interview. Questions were understandable as the respondents usually answered quickly, but not all were able to answer to directly political questions.
- There was nothing especially complicated, but it was tedious for both interviewer and respondent to read questions that appeared similar.
- About half of the respondents were enthusiastic about a chance to make their voice heard. And the rest couldn't think anything more insignificant… Young girls had somewhat more problems with understanding than the rest.
- Quite good questions, respondents found the survey usually interesting, good, necessary.
- Question about religiousness bothered me – I don't think it really describes faith but on the other hand conservatism or even fanaticism. Some items about "direct action" were wondered about as these things never happen here.
- In general questions were easy and logical as such, but young people just don't understand politics. Some questions were too long, however.
- Under 20 year old respondents found the questionnaire difficult, especially questions Q24, Q27 and Q28.
- Quite good questions – respondents did not have particular difficulties.
- Q13 was exhausting. The questionnaire should have been more upbeat, clear and shorter. Questions Q24 and Q28 were especially difficult.
- Respondents were in general satisfied with the interview, they found the topic good. Some respondents answered very thoroughly.
- Rather fluent questionnaire, although Q13 was too long. Some respondents found the topic boring. Q30 was not well understood. Questionnaire was of suitable length.
- Respondents appeared to understand the questions well in general.
- Younger respondents had difficulties with understanding central concepts (left/right etc.). Additionally, some could not assess others' interest. Otherwise fine.
- Respondents in general understood the questions were found clear and understandable. Respondents appeared interested to find out more about the issues.
- Respondents were interested in questions. They took the survey as a "test". Estimating parents' knowledge was difficult to most, though.
- Respondents said that this survey made them think more about political issues. Q20 and Q27 appeared repetitive.
- Left/right was not always understood.
- There were perhaps too many questions. Some parents prevented their children from participating.

- Questionnaire was quite suitable. Younger respondents found some of the questions too intrusive.
- Questions were a bit too political. Difference between left and right was not understood by all. Some questions were found too similar, almost duplicates. Still, in general there was interest towards the survey.
- Respondents would have hoped for easier/better topic. Assessing parents was found often very difficult.
- Relevant questions!

Difficulties in realizing sample, weighting, data entry

No known special difficulties although there are always challenges with realizing face-to-face surveys.

6. Field report France

6.1 Basic information about the study:

Name of the study: Euyoupart: Political Participation of young people in Europe

Field institute: CSA, 22 rue du 4 Septembre – BP6571 – 75065 Paris cedex 02

Project Manager : Bruno Jeanbart

Contacts : Bruno Jeanbart
Bruno.jeanbart@csa.fr.com
Julien Goirant
Julien.goirant@csa.fr.com

6.2 Sample descriptions:

• **Target population**: 1000 French resident aged 15 to 25

• **Description and documentation of sampling strategy (description)/ sampling design :** to make sure that the sample was able to satisfy your ask and respect our methodology, we did use a random representative strategy with a stratification of the area to be representative and specifics asks (concerning the level of education and the religion).Those specific asks were not quotas and were applied because by experience we noticed that in France some target are often forgotten into studies because they frequently refuse to answer. We used the birthday methodology to select the interviewee, if they were more than one in the household randomize.

• **Procedure of sampling** :

sample size: 1010

type of interview : face to face, PAPI Method

duration of interviews : average given by interviewers : 35 minutes

overview chart on structure of sample : cf specific table

6.3 Field design:

• **Number of interviewers** : 114

• **Age and gender distribution of interviewers** : interviewers with at least 2 years of experience, both men and women, from 22 to 65 years old

• **Number of sampling points** : 114

• **Exact date of fieldwork**: from the 03th to the 26th of November 2005

• **Process of data collection, organisation of fieldwork :** each interviewer did 10 interviews conducting the questionnaires regarding our briefing. Coordination was under responsibilities of our field manager.

• **Information on interviewer briefing, method of briefing** : The briefing was made to our regional manager by us and Anne Muxel the survey manager in France. Then each regional manager briefed is own team by phone.

6.4 Quality control:

• **Which measures were taken to ensure a high quality of the interviews/data** :deep and personal brief of the interviewers, written guideline to all of them, use of show cards, permanent phone number at disposal of the interviewers.

• **Analysis of contact protocols:** random selection of household, verification of the presence of someone of the target in the household, birthday methodology to select the interviewee if more than one

• **Which procedures were applied to control the interviewers :** 20% of the interviewees were called back by phone.

• **Measures / procedures that were applied by field institute to check quality of data** : rereading of the questionnaires in application of the guidelines.

6.5 Interview situation (= Analysis of interviewer questionnaire)

• **Readiness to be interviewed :** 7% refusal, sometimes appointments had to be taken

• **Presence of other persons during interview** : never, but agreement from their parents for people under 18 when living at their parents home

• **Interference of other persons** : none

6.6 Difficulties during fieldwork / deviation from planned procedures

No difficulties with the sample, the weighting or the data entry, but the use of SPSS for those process is sometimes a bit heavy.

Overview chart on structure of the sample

		Distribution

7. Field Report Germany

7.1 Preface / Basic Survey Information

The “EUYOUPART – Political participation of young people in Europe. Development of indicators for comparative research in the EU“ is an international research project funded by the European Union. It serves to develop a measurement instrument to measure political participation of youth in Europe. The infas Institut für angewandte Sozialwissenschaft GmbH in Bonn (Institute for Applied Social Sciences) is responsible for the realisation of the German part on behalf of the DJI Deutsches Jugendinstitut e.V. (German Youth Institute) Munich.

The study has been supervised at infas by Birgit Jesske, Senior Project Manager, and Dr. Angela Prussog-Wagner, Project Manager. Dr. Franziska Wächter, Project Manager, has been available for the co-ordination and reporting from the ordering party’s side (DJI).

The study’s field work started in summer 2004 with the implementation of a preliminary study which enabled us to check the length of the interview and also the comprehensibility of the operationalised questions. Last but not least, the second aspect focussed on checking the translation for the individual countries. To simplify matters, the preliminary study was based on a quota sample. infas conducted 102 interviews with respondents of the relevant age group from 15 to 25 years for the pretest. The detailed pretest’s results’ documentation were delivered to the central project organisation in Vienna (see annex).

The essential result of the pretest was an apparent exceeding of the projected length of the interview, so that the interview had to be shortened considerably for the main survey, whereby the primarily scheduled start of the study had to be postponed from the beginning of October to the beginning of November. This scheduling delay of the field start could not indeed be compensated by a simple postponement of the entire field period for the main survey, because the project’s data were due to the end of the year. The consequence was a really short field period of five weeks.

The present methodological report documents all steps of the empirical study and also of the realisation of the main survey for the German part in line with this research project.

The following comprising section depicts the survey’s design at a glance, before going into detail concerning the individual steps and results in the further course.

7.1.1 Survey Design

EUYOUPART as internationally designed study, along with the contextual interest, was also supposed to embark on methodological interest. Possible country-specific differences ought to provide indications for the feasibility of international comparative research under equal field conditions and equal procedures. The frame parameters of

the sampling procedure and the field work were consistently specified for all countries. The following basic components of the survey design result from the German survey:

7.1.2 Sample

Respondents of this study are juveniles and young persons residing in the Federal Republic of Germany aged from 15 to 25 years.

1,000 persons of this age group in total should be interviewed nationwide. Addresses from the last Jugendsurvey (Youth Survey), which infas realised for the DJI in the end of 2003, were available for winning over respondents. Starting point of the Jugendsurvey (Youth Survey) was a registry offices' sample. The relevant respondents aged from 12 to 29 years were drawn from the registry offices of 250 representative selected municipalities. Subsequent to the interview all persons were asked for their willingness to take part in the panel. The drawing procedure for EUYOUPART fell back on this address-pool of the panel-willing respondents. Yet, the group of respondents to be selected was limited to the age group from 15 to 25, and the number of municipalities was reduced to 96, the latter due to practicability concerning interviewer employment.

A fundamental advantage of samples drawn from registry offices is that the drawing base can be defined in detail by restricting the target group which leads to definite information about the population. Furthermore, basic information (age, nationality and place of residence) is available for respondents who cannot be contacted resp. can only be motivated with great effort - if the municipalities are allowed to provide this data by their respective registry law. Selectivity analyses can be carried out by means of this basic information. Another advantage of samples of individuals results from the easier approaching of the respondents, the field monitoring and the field control. The interviewers receive subject-centred addresses to work on. Moreover, the quality of the interviewers' work can be checked more thoroughly by post controls.

7.1.3 Approach and Motivation of the Respondents

The decision for a sample of individuals provides the opportunity to approach the respondent before the interviewer contact by a personal letter containing information about the study's background, objectives and its ordering party as well as the requirements of data protection. The personal approach by letter is especially important with regard to recontacting the already in 2003 interviewed persons in order to justify the source of their address and a new approach.

7.1.4 Survey Method

The survey was realised by face-to-face-interviews in order to ensure comparability of the survey method for all participating countries. The personal presence of the interviewers throughout the interviewing situation allows a better control of situation's confidentiality and enables flexible access even to the group of mobile, younger persons.

7.1.5 Survey Instruments

A standardised questionnaire was used for the face-to-face-interviews, supported by show cards which were presented to the respondents in the course of the interview.

7.1.6 Contact File

Uniform standards for the addresses should have been defined in all partaking countries regarding documentation and field work in order to reach high data quality on all levels. Thus, the implementation of contact files is indispensable. The interviewer records the work on each single address on-site in the contact file. After reception of the survey documents at infas, all the information will be recorded in a central database and are therefore available for the subsequent analysis of the field work and also for consideration of the response rate.

7.1.7 Selection and Training of Interviewers

The interviewers employed in this survey were particularly selected because of their former employment in the Jugendsurvey (Youth Survey) in 2003. These interviewers could fall back on their experiences with interacting with the target group, yet also with the contextual topic of the survey. In total, 93 interviewers were employed in EUYOUPART.

All survey steps and particularities were documented in a detailed manual that the interviewers had to read carefully prior to their work on-site. The project managers in charge were responsible for personal contact to the interviewers and could be contacted in case of further inquiries or when in need of additional training throughout the entire field period.

The following synopsis depicts in summary the most important basic components of the main survey design at a glance:

Table 1: Synopsis Survey Design

Main Survey	
Survey Period Realised Cases	Time period: 1. November until 7. December 2004 n=1,073 interviews – edited response rate 64.1%, therefrom 1,037 complete interviews
Sample Respondents Selection procedure	 Persons residing in the Federal Republic of Germany aged from 15 to 25, foreign nationals also (if German speaking) Registry offices' sample in 96 municipalities
Survey Method Length of Interview Pretest	Face-to-face-interviews Average of 25.4 minutes n=102 interviews (from 9. July to 22. July 2004)
Field Design Interviewer Employment Training Method	 n=93 interviewers frequent feedback throughout field period written interviewer manual
Field Control	documentation of contact process in contact file weekly field report to DJI postal interviewer control
Data Edition	return control Data edition – delivery as SPSS-file

7.2 Sample Description

7.2.1 Target Population

The target population is defined as inhabitants of the Federal Republic of Germany aged from 15 up to 25 years (in August 2004).

7.2.2 Sampling Strategy and Design

As described above, the sample was composed out of the address pool of the panel-willing respondents from the DJI Jugendsurvey 2003 (Youth Survey), implementing a two-stage random design:

- In the first stage, a representative municipalities' sample was drawn with regard to the regional distribution – stratified by federal state and municipality size (BIK10 size category).
- In the second stage, the respondents were randomised within the selected municipalities by a simple random process.

7.2.3 Sampling Procedure

In the first step of the sampling procedure, the sampling points[1] have to be selected out of the municipalities. As a rule, each sampling point covers one municipality, yet the large cities Hamburg (two sampling points) and Berlin (four sampling points) comprise more than one. 100 of these sampling points (78 in the old and 22 in the new federal states) were randomised proportional to federal state and municipality size[2].
In the second step, a maximum of 20 addresses of respondents out of each single sampling point were selected by means of simple random sampling. For sampling points with less than 20 panel-willing persons, only less addresses could be selected accordingly. The minimum number of persons for a sampling point is 14, yet for 28 sampling points in total, the maximum could not be obtained. The following table shows the distribution of the sample of individuals by federal states.

Table 2: Distribution of the Sample of Individuals by Federal States

	Federal State	abs.	%
1	Schleswig-Holstein	38	2.0
2	Hamburg	40	2.1
3	Niedersachsen	225	11.8
4	Bremen	20	1.0
5	Nordrhein-Westfalen	396	20.8
6	Hessen	133	7.0
7	Rheinland-Pfalz	80	4.2
8	Baden-Württemberg	232	12.2
9	Bayern	240	12.6
10	Saarland	39	2.0

[1] The term "sampling point" has to be interpreted in this context as statistical term and not as a precise locatable, selected cluster like e.g. in constituency samples.
[2] Berlin, with two sampling points each, was assigned to the old as well as the new federal states.

11 Berlin (Gesamt)	80	4.2
12 Brandenburg	40	2.1
13 Mecklenburg-Vorpommern	99	5.2
14 Sachsen	95	5.0
15 Sachsen-Anhalt	96	5.0
16 Thueringen	55	2.9
Total	**1,908**	**100.0**

7.2.4 Effective Sample Size

In total, 1,073 interviews could be realised throughout the predetermined field period, also containing 36 incomplete resp. incomplete interviews, so that n=1,037 complete interviews could be included in the data analysis.

7.2.5 Type of Interviews

The study was conducted as a face-to-face interview, paper-and-pencil with standardised questions. The responding of the respondents was facilitated by use of show-cards.

7.2.6 Duration of Interviews

The average interview duration was 25.4 minutes. The shortest interview took 15 minutes, the longest 60 minutes. The length of the interview slightly increased with advancing age, e.g. already in the age group from 19 to 21, the length of the interview increased at an average of two minutes.

Table 3: Duration of Interviews by Age (Average in Minutes)

Age Groups	Min. – Max.	Mean
15 – 18 years	10 – 58	24.6
19 – 21 years	13 – 60	26.4
22 – 25 years	10 – 55	25.9
In Total	**10 – 60**	**25.4**

n=1,037 cases

7.2.7 Sample Structure

Table 4 depicts the distribution of the realised interviews concerning the sociostructural characteristics and the respondents' residential environment.

Table 4: Sample Structure – UNWEIGHTED DATA

		Distribution	
		n	%
Total		1,037	100
Gender	Female	501	48.3
	Male	536	51.7

	in community or military service	14	1.4
	housework, care taking	19	1.8
	Other	29	2.8
Living area	Rural area (village / farm / home in the country)	386	37.2
*) q48	Town or small city	351	33.8
	Urban area (big city / suburbs or outskirts of big city)	299	28.8

**) *Differences in the absolute resp.percentage values result from missing data in the questionnaires*

7.2.8 Response Rate

The edition of the sample and the associated response rate are, among other things, essential for the quality of the collected data. Thus, a high response rate does not necessarily means a high quality. It is important to systematically avoid biased effects by the procedure and the work on the drawn addresses.

1,908 addresses were used in order to realise the targeted 1,000 interviews throughout the field period. For the decision about the size of the gross sample was basically considered, how much time in total was available for working on the addresses also taking into account the particualrities of the target group, assuming that a quite large part of the latter to be contacted cannot be interviewed, because the drawn target person moved to an unknown address, or is unknown under the drawn address resp. is temporarily away from home because of a professional training. Moreover, not much time could be spared for the tracing of single addresses resp. re-editing due to the short field period. The share of moved resp. untraceable addresses will be valued as so-called non-sample and will be removed from the gross sample for the analysis of the response rates (edited gross sample). Deceased persons or persons who cannot be interviewed because of health problems also belong to this non-sample group. All other nonresponses are systematic, particularly with regard to the survey topic, and have to be differentiated by west/east, BIK-municipalities' size categories, federal state, age and gender of the respondents. The information for the work on the individual addresses was taken from the interviewers' record of the contact files (see also chapter 4). Systematic nonresponses also contain such addresses, where the respondent could not be contacted, or no appointment could be made until the end of the field period. Particularly concerning this survey's relevant target group, it was preliminarily assumed from the previous experiences that a large share accounts for non-available respondents, which actually is the case in ten percent of the used addresses. Within longer field periods, the share of respondents who cannot be contacted until the end of the field period can normally be reduced to almost five percent. The share in East-Germany exceeds the share of West-Germany by eight percentage points. East-Germany also results in a higher share concerning the non-sample. With an average share of 12.3 percent, the eastern share reaches 17.6 percent and again exceeds West-Germany by almost seven percentage points. Already in the last Jugendsurvey (Youth Survey), East-Germany had a higher mobility resulting from less job opportunities, among other things.

Table 5: Response Rate in Total for West/East

	West		East		In Total	
Gross Sample	**1,483**	**100.0%**	**425**	**100.0%**	**1,908**	**100.0%**
Non-Sample						
Address wrong/incorrect, respondent unknown	16	**1.1%**	7	**1.6%**	23	**1.2%**
Respondent moved	98	**6.6%**	44	**10.4%**	142	**7.4%**
Respondent does not live there temporarily (studies/ education, stay abroad)	45	**3.0%**	23	**5.4%**	68	**3.6%**
Respondent cannot be interviewed as per information (ill, handicapped)	0	**0.0%**	1	**0.2%**	1	**0.1%**
Non-Sample in Total	159	**10.7%**	75	**17.6%**	234	**12.3%**
Edited Gross Sample	**1,324**	**100.0%**	**350**	**100.0%**	**1,674**	**100.0%**
Systematic Nonresponses						
Contact to respondent resp. appointment impossible	107	**8.1%**	57	**16.3%**	164	**9.8%**
Other person in household refused	44	**3.3%**	15	**4.3%**	59	**3.5%**
Respondent refused	317	**23.9%**	61	**17.4%**	378	**22.6%**
Systematic Nonresponses in Total	468	**35.3%**	133	**38.0%**	601	**35.9%**
Realised Interviews						
Realised Interviews in Total	**856**	**64.7%**	**217**	**62.0%**	**1,073**	**64.1%**
thereof:						
Interview realised - complete	830	**62.7%**	207	**59.1%**	1,037	**61.9%**
Interview realised - incomplete (aborted, no data	26	**2.0%**	10	**2.9%**	36	**2.2%**
Response Rate Gross Sample		**57.7%**		**51.1%**		**56.2%**
Response Rate Edited Gross Sample		**64.7%**		**62.0%**		**64.1%**

Differentiated reflexion of systematic as well as unsystematic nonresponses concerning regional and individual characteristics provides a more detailed insight into specific selectivities.

Especially when considered by age groups, it is clear that the group for the nonresponse reason “moved” prevails in the age group from 22 to 25 and “does not live there temporarily“ in the age group from 19 to 21. Both nonresponse reasons also prevail with female respondents than male ones.

Table 6: Distribution Within Non-Sample by Age Groups, Gender, West/East and BIK-Municipalities’ Size Categories (GGK)

	Address wrong / incorrect		Respondent moved		Respondent temporarily does not live there		Respondent as per information permanently ill, cannot be interviewed		Total

Total	23	**100.0**	142	**100.0**	68	**100.0**	1	**100.0**	234	**100.0**

An edited response rate of 64.1 percent could be realised in total which varies minorily within the characteristics gender and West/East only. Yet, it shows that the younger age group from 15 to 18 years reached a significantly higher response rate of 72.5 percent, less resulting from refused participation but from the less share of “not available” respondents. Only six percent of the youngest age group could not be contacted until the end of the field period, compared to 14.3 percent in the oldest age group. This is most likely due to only five field weeks, insufficient for the interviewers to adequately and flexibly accept the mobile age group’s preferred appointments resp. to even contact the hardly ever available respondents more frequently.

7.3 Field Design

7.3.1 Number of Interviewers

In total, 93 interviewers have been deployed. All of them employees, who have been working for infas for many years, and whose work in different projects has been convincing in quality and reliability.

All interviewers are skilled in conducting face-to-face interviews, especially with the relevant target group. 15 of them already had taken part in this study's pretest.

7.3.2 Age Distribution and Gender of Interviewers

Out of all 93 deployed interviewers, 47 interviewers are male and 46 female. The interviewers' average age is 47, whereas the age ranges from 23 to 68 years.

Table 9: Interviewer Characteristics

Interviewers		n	%
Gender	**male**	47	50.5
	female	46	49.5
Age	**23-30 years**	7	7.5
	31-40 years	19	20.4
	41-50 years	25	26.9
	51-60 years	33	35.5
	61-68 years	9	9.7
In Total		**93**	**100%**

7.3.3 Number of Sampling Points

96 municipalities were selected for the sample. The addresses were almost equally distributed among the individual municipalities, whereas the numbers for large cities resp. city states like Hamburg and Berlin were doubled resp. quadrupled, resulting in a distribution of 14 to 20 addresses per each of the 100 sampling points (see also chapter 2.3).

Each interviewer was to work on one point as a rule. In exceptional cases, several interviewers were responsible for working on two points. However, this was only possible, when adequate work on all addresses and the meeting of the delivery dates could be ensured throughout the very short field period.

7.3.4 Exact Dates of Field Work

The field period was set for the time from 1. November until 15. December for all involved institutes. On 15. December the collected data ought to be delivered, thus defining 8. December as the last possible delivery date for the interviewers. With regard to the mail delivery time, enough time for data entry and data check should be available. All respondents received a personal letter in advance also enclosing a data protection note (see annex) which were posted on 14. October 2004.

Approximately one week later (22.10.2004), the interviewers received the entire survey materials (questionnaires and show cards as well as the interviewer manual) and the contact file sheets were sent to the interviewers.

The first interview was conducted on 30. October and the last interview on 7. December 2004. The interviewer started work immediately which can be illustrated by the following distribution of the realised interviews throughout the field weeks.

Table 10: Distribution of Realised Interviews by Field Weeks

Field Weeks	n	%
Start until 07.11.2004	162	15.6
08.11.2004 until 14.11.2004	281	27.1
15.11.2004 until 21.11.2004	319	30.8
22.11.2004 until 28.11.2004	169	16.8
29.11.2004 until the end	106	10.2
In Total	**1,037**	**100%**

The questionnaires from the field were returned successively in order to ensure efficient processing of the documents. As from 5.11.2004 the first interviews arrived at infas. All interviewers were instructed to dispatch their first interview without delay to the infas field management in order to allow for data quality check and the compliance with the interviewer instructions. From now on, further interviews were returned once per week. The last interviews came in on 8. December.

7.3.5 Field Organisation and Process of Data Collection

The personal letter, sent in advance to all respondents, was to inform about the ordering party as well as the survey's objectives, and thus to facilitate the interviewers' approach. Additionally, the letter also included information about data protection and a special note concerning the voluntariness of participation. The data protection note provided information about the participating institutes and the responsible data protection officers. On the back, an exemplary explanation could be found about what happens during the anonymised process with aggregated individual data. Moreover, the letter also allowed for an address check. Those returned letters referring to a new address could, prior to the field start, be updated and delivered to the interviewer by pointing out the new address. Yet, only address modifications within a municipality were traced, all other address losses were considered as non-sample. Basically all addresses were given to the interviewers, even if the personal letters could not be delivered. The interviewer had to check the address status on-site again.

The interviewers returned their processed field documents successively. All documents were checked immediately upon delivery and forwarded to the data entry department (see also chapter 4.4).

Out of the 93 deployed interviewers, each interviewer realised an average of 11 interviews. In total two-thirds of the interviewers realised between six and 15 interviews. Approximately each tenth interviewer realised more than 20 interviews with a maximum

value of 38 interviews per interviewer (n=1). Only 16 percent of the interviewers realised less than six interviews.

Table 11: Average Number of Interviews per Interviewer

	West	East	In Total
Number of Interviewers	**71**	**22**	**93**
Number of Interviews per Interviewer (mean)	**11.7**	**9.4**	**11.1**

Table 12: Distribution of Number of Interviews per Interviewer

Clustered Number of Interviews	Number of Interviewer	
	abs.	%
1- 5 interviews	**15**	**16.1**

11-15 interviews	**28**	**30.1**
16-20 interviews	**5**	**5.3**
21-38 interviews	**10**	**10.8**
In Total:	**93**	**100%**

7.3.6 Interviewer Briefing

Before the main survey's starts, all interviewers were briefed in written form by infas. Thus, an interviewer manual was produced and handed over to the interviewers as a personal copy.

The interviewer manual, in addition to standard interviewer instructions (e.g. information how to use the contact record files as well as instructions how to conduct a conversation and interviewing techniques), gives a review about the structure of the questionnaire, explaining the used scales as well as how to cope with missing data, along with formal aspects, e.g. indication of interviewer hints and filter questions.

The field manager in charge could be contacted in case of further questions or problems throughout the entire field period.

The return of the first interview also allowed for interviewer training. This first interview, in particular, was thoroughly checked in order to identify potential problems resp. difficulties comprehending the handling of the material right in the beginning of the field period, and to be able to give feedback to the interviewers if required. Thus, the correct methodological handling of the survey materials could be checked and ensured from the very first.

7.3.7 Interviewer Instructions

The interviewers were instructed to contact the respondents at least four times, unless an interview could be realised earlier. An average of 2.7 contact attempts were necessary to conduct an interview.

The analysis of the contact frequency shows that only in ten percent of all cases an interview could be realised at first contact. Just under half of all cases (45 percent), an interview succeeded the second contact attempt. In nine percent, more than five contacts were necessary for realising an interview resp. even getting in contact with the respondent, with a maximum value of eight contact attempts.

Table 13: Distribution of Contact Attempts Necessary for Realisation of Interviews (n=1,037)

Number of Contact Attempts	abs.	%
1 contact	100	9.6
2 contacts	467	45.0
3 contacts	271	26.1
4 contacts	109	10.5
5 and more contacts	90	8.7
Interviews in Total	**1,037**	**100%**

7.4 Quality Control

7.4.1 Measures to Ensure a High Quality of the Interviews / Data

The analysis of the current field status and the thus involved determined field control were based upon the so-called contact record files, containing the contact process resp. the work on the addresses per respondent (see chapter 4.2).

- Additionally, all returned interviews in the course of the field period were checked by routine before handing them over to the data entry department. In a first step, all survey materials were manually compared to the gross sample and checked according to completeness and plausibility, including among other things:
- the correct interviewers' handwritten entry of the case-ID onto the questionnaire,
- the complete and coherent work of the contact record file,
- the compliance with the filtering within the questionnaire as well as
- the complete work on the interviewer information (date, interviewer-ID, location).

After the manual check, all correct questionnaires were handed over to the data entry department, yet separating the data from the address work (contact record files) and the questionnaires.

7.4.2 Contact Forms / Protocols

After having drawn the sample, an assignment file was produced, containing the present sample information and also the interviewer_IDs. The contact record files for each interviewer and each selected respondent were produced out of this file.

Throughout the field period, all interviewers kept records in the contact record files for all addresses they had to work on. The contact record file includes information about each single contact: the way of contact (by phone or personal), the contacted person, date and time of the contact, whether an appointment could be made, and the contact status (whether an interview could be realised resp. why no interview could be conducted (see contact record file in annex).

At infas, the contact record files are saved in total in a sample management system (Access data base) via the interviewer administration system. Thus, data from the assignment data base table about respondents and interviewers can be displayed on screen during the data entry process. The field status will be analysed in terms of return statistics which can show the work status aggregated by sampling points as well as based upon individual addresses. For the latter, the contact process resp. the number of contacts can be analysed. Moreover, the success of each single interviewer‘s performance can be illustrated. All analyses can be made by default via the interviewer administration system and allow the field assignment team for field control.

7.4.3 Procedures of Interviewer Control

The interviewers were monitored throughout the field period according to data quality assurance and were continually in close personal contact with the infas field management.

In addition to the ongoing control via contact record files, infas also routinely implements an interviewer post-control. As a rule, the first step of this post-control is carried out in postal form. In case of distinctive features, infas will immediately initiate full means of control for the interviewer concerned. Those means of full control is often carried out by phone in order to avoid unnecessary delay due to mail delivery time. For this survey, a postal control was scheduled in 20 percent of the realised cases.

In the course of the postal interviewer control, the respective respondents were asked to state, whether an interviewer had conducted the interview face-to-face within the field period, how much time the interview had taken, and whether the show cards had been used, followed by questions about personal data such as age and religious affiliation.

230 interviews were selected at random for the interviewer post-control, matching a control rate of 22.2 percent. The randomly selection ensured that each sampling point and each interviewer would be taken into account. The control was already carried out throughout the ongoing field period. The first 120 interviews were controlled on 25.11.2004, the last 110 interviews on 9.12.2004.

A letter was used for this control also enclosing a short letter of thanks. The questions for controlling the interviewers mentioned above should be completed on a reply sheet that could be returned to infas postage free.

114 out of 230 contacted respondents returned a completed reply sheet confirming the correct realisation of the interview.

7.4.4 Data Control

The data was captured via an input mask already containing plausibility and value range checks. Therefore, the captured data exactly corresponded the interviewer's data, i.e. the data entry department did not alter nor edit the data.

Afterwards, the plausibility check was carried out by SPSS automatedly. In case of discrepancies, an editing error has to be strictly excluded at first by checking the data in the original questionnaire. If an editing error occurred, it will be edited immediately. The actual data of the questionnaire remains unchanged – entirely in terms of a methodological survey like EUYOUPART.

Since infas normally works with data entry conventions regarding missings (refused, don't know, no comment) deviating from the ones mentioned in the obligatory "Guidelines for Field Work", we recoded the respective codes according to the demands of the "Guidelines" as requested. Yet, the differentiation between the individual missing codes disappears in many variables as a matter of course. Further editing was not scheduled.

Upon completion of the real data edition with the means mentioned above, SORA asked for a fractional data editing in compliance with the following guidelines concerning inconsistencies in the respondents' data:

Edition of filtering in the questions Q7 to Q9 as well as Q10 to Q12:
If Q7 (Q10) = 0 or 77, then Q8 (Q11) and Q9 (Q12) = SPSS system missing.
If Q7 (Q10) = 1 and Q8 (Q11) unequal 1, then Q9 (Q12) = SPSS system missing.

Edition of questions Q13:
If Q13a = 1 and Q13b = SPSS system missing, then Q13b = 77.
If Q13a = SPSS system missing and Q13b = 0, then Q13a = 0 and Q13b = SPSS system missing.
If Q13a = SPSS system missing and Q13b larger than 0 and less than 77, then Q13a = 1.

Edition of filtering in question 16:
If Q16 = 0, then Q17 = SPSS system missing.

Edition of questions Q18:
If Q18_1 = 1 or Q18_2 = 1 or Q18_3 = 1, then Q18_4 = 0.
If Q18_4 = 1 and Q18_1 = SPSS system missing, then Q18_1 = 0.
If Q18_4 = 1 and Q18_2 = SPSS system missing, then Q18_2 = 0.
If Q18_4 = 1 and Q18_3 = SPSS system missing, then Q18_3 = 0.

Edition of question Q40:
If Q40b = 1, then Q40a = SPSS system missing.

Further editing rules were not determined. The edition of cases where respondents did not state any data is not possible since no rules (neither filter nor editing rules) were determined for such cases. In those cases, the respective variable shoes “SPSS system missing“.

7.5 Interview Situation

The succeeding analyses are based on the interviewer questions addressing the interviewer at the end of the questionnaire. They had to be completed without the respondent being present. The interviewers were asked to assess the interview situation by completing these standardised questions, thus allowing to draw conclusions about the atmosphere as well as the respondents’ co-operation willingness. Moreover, the interviewers were also asked to state whether the interview was realised with the respondent alone or whether a third party was present.

7.5.1 Response Willingness

The interviewers experienced in 93 percent of the respondents a high response willingness in total, only in seven cases, the response willingness was bad throughout the interview (0.7 percent). In two cases, the high willingness in the beginning worsened in the course of the interview, and in another two cases, the willingness improved after having been assessed as bad in the beginning of the interview.

Table 14: Response Willingness

Respondents‘ Co-Operation	n	%
1 Good	966	93.2
2 Medium	51	4.9
3 Poor	7	0.7
4 Good start, then worse	2	0.2
5 Poor start, then better	2	0.2
In Total *)	**1,037**	**100%**

*) *Differences in the absolute resp. percentage values result from missing data in the questionnaires.*

7.5.2 Reliability of Responses

Regarding the reliability of the respondents' statements, the interviewers positively assessed them in almost 94 percent of all cases: the answers were rated as "completely reliable". Only in 17 cases, the interviewers rated the statements of the respondents as „not so reliable" (1.6 percent). In 41 cases, the answers to certain questions were thought to be less reliable (4.0 percent).

Table 15: Reliability of Responses

Respondents' Reliability	n	%
1 Reliable	971	**93.6**
2 Not so reliable	17	**1.6**
3 Sometimes not so reliable	41	**4.0**
In Total *)	**1,037**	**100%**

*) *Differences in the absolute resp. percentage values result from missing data in the questionnaires.*

7.5.3 Third Parties' Presence Throughout the Interview

It is important that an interview can be conducted unhurriedly and without anybody else present apart from the interviewer and the respondent, because the presence of a third party throughout the interview can lead to distraction and also to a distortion of the respondents' answers.

Almost 85 percent of all interviews could be realised without a third party being present according to the interviewers' statements. In the other cases (n=154), a third party was present during the interview. The analysis differentiated by age of the respondent shows that a third party was most frequently present in the youngest group aged from 15 to 18 (19.1 percent). Yet it has to be considered that underage persons were included in this age group, who could only be interviewed with parental consent.

Table 16: Third Parties' Presence During the Interview by Age Groups

	Interview Realised with Respondent Alone		Third Parties' Presence		In Total)	
Age Groups	abs.	%	abs.	%	abs	%
15 – 18 years	430	80.7	102	19.1	533	100.0
19 – 21 years	219	93.2	15	6.4	235	100.0
22 – 25 years	231	85.9	37	13.8	269	100.0
In Total	**880**	**84.9**	**154**	**14.9**	**1,037**	**100.0**

In case of other persons present during the interview (n=154), the interviewers recorded precisely who this person was. Multiple answers were possible concerning the differentiated statement about the type of the present third party.

As shown in Table 17, in 20 cases the partner of the respondent was present, in eight cases the respondents' child(ren) as well as other persons in further 17 cases. In total, other family members were present most frequently (n=115). A differentiation by age groups makes clear that most frequently the youngest group from 15 to 18 was joined by a third party: normally the respondent's parents.

Table 17: Third Parties' Presence by Type of Person

	Partner		Children		Other Family Members		Other Persons

7.6 Difficulties During Field Work / Deviations from Scheduled Procedures

7.6.1 Difficulties During Field Work

The field work could be realised without any difficulties. Only the short field time caused high deadline pressure for all parties involved. Consequently all interviewers were at disadvantage because they were not able to contact all addresses effectively. The interviewers reported solely positive experiences concerning the survey contents and the interaction with the selected target group.

No difficulties occurred throughout the subsequent data entry process either.

7.6.2 Difficulties of Realising Sample and Weighting

The survey was highly accepted from the respondents, and it was clearly an advantage that the respondents had already been contacted in advance with regard to the Jugendsurvey (Youth Survey). Yet, the response rate differs in the age groups and therefore deviates from the official statistics. Against this background, an age weight was added. Further weighting variables were neglected, the more so as no official case numbers for certain surveyed data could be provided from the official statistics, e.g. the official statistics includes the trainees in the labour force.

8. Field Report Italy

8.1 Basic information about the study

Information about the study's management
The Italian quantitative survey has been scientifically supervised by Gloria Cornolti and Fabio Cotti (Fondazione IARD).

8.2 Sample description

8.2.1 Target population

The target population is young people aged from 15 to 25 years old having the Italian nationality. The nationality criteria regarded only over 18 young people. This decision was taken in order to respect the procedure of sampling (see below).
It is important to underline how the presence of other nationality among youth represents just a small percentage among Italian population.

8.2.2 Description and documentation of sampling strategy and sampling design

1000 young people address were *randomly* selected, through a *stratified multistage sample*. The address lists have been extracted from electoral lists (people from 18 to 25 years old) and from phone lists (people under 18 years old). For the sake of reducing sample error, this population was stratified according to the following variables:

- Gender: males vs females;
- Age: 15-19 vs 20-25;
- Geographic area: Northern Italy, Central Italy, Southern Italy[3];
- Dimension of the municipality of residence: Urban vs Rural[4];

The source of data for the variables "Gender", "Age", "Geographic area" and "Dimension of the municipality of residence" has been provided by "Istat demographic statistics of the resident population at municipal level", including gender and age; the data are updated to January 2003.

[3] The Northern area is composed of the regions of Emilia Romagna, Friuli Venezia Giulia, Liguria, Lombardia, Piemonte, Trentino Alto Adige, Valle d'Aosta and Veneto; the Central area is composed of the regions of Lazio, Marche, Toscana and Umbria; the Southern area is composed of the regions of Abruzzo, Basilicata, Calabria, Campania, Molise, Puglia, Sardegna and Sicilia.
[4] Municipalities with more than 10.000 residents, or belonging to metropolitan districts (according to Istat classification Torino, Milano, Venezia, Genova, Bologna, Firenze, Roma, Napoli, Bari, Palermo, Catania, Cagliari) are considered urban. The remaining municipalities are considered rural.

Table 1: Percentage distribution of the population according to the strata (Font: Istat 2003)

Gender	*Age*	*Area*	*Dimension*	*Total*
Boys	15-19	North	Urban	5,1
			Rural	2,9
		Centre	Urban	3,0
			Rural	0,7
		South	Urban	7,4
			Rural	2,3
	20-25	North	Urban	7,5
			Rural	4,2
		Centre	Urban	4,3
			Rural	1,0
		South	Urban	9,7
			Rural	2,9
Girls	15-19	North	Urban	4,9
			Rural	2,8
		Centre	Urban	2,8
			Rural	0,7
		South	Urban	7,0
			Rural	2,2
	20-25	North	Urban	7,2
			Rural	4,0
		Centre	Urban	4,1
			Rural	1,0
		South	Urban	9,4
			Rural	2,8
Total				100,0

The effective sample of 1000 young people (table 2) has been approximately adherent to the distribution of the population showed in table 1. In order to weighting variables, Istat distribution was finally respected.

Table 2: Percentage distribution of the effective sample

Gender	*Age*	*Area*	*Dimension*	*Total*
Boys	15-19	North	Urban	6,2
			Rural	2,2
		Centre	Urban	2,9
			Rural	0,7
		South	Urban	7,4
			Rural	2,3

		Centre	Urban	3,9
			Rural	0,9
		South	Urban	9,6
			Rural	2,7
Total				100,0

8.2.3 Procedure of sampling

The procedure of sampling has been realized as followings.
First, 100 municipalities were randomly extracted (sample points) according to the national stratification (Source: Istat 2003) and adopting probabilities proportional to demographic municipalities dimensions; then the address lists have been randomly extracted according to the distribution showed in Table 1.

Specifically the 100 sample points have been randomly extracted among the 8101 Italian municipalities according to the following criteria:
Municipalities characterized by Urban dimension have been extracted with
probability equal to 1, in the case of the 12 Italian metropolis (self representing units); where 25 interviews (per metropolis) have been carried out;
randomly, with probabilities proportional to the number of people between 15 and 25 years old, resident in each municipality of the correspondent geographical area; in this case 10 interviews have been carried out per each selected municipality
Municipalities characterized by rural dimension have been extracted randomly with probabilities proportional to the number of people between 15 and 25 years old, resident in each municipality of the correspondent geographical area; in each selected municipality, from 6 to 12 interviews have been carried out.

The adopted criteria allow to be sensitive to the different variability of the interviewees resident in different municipalities: more interviews have been carried out in the bigger municipalities, while a higher number of small municipalities have been extracted. In the bigger municipalities we extracted people from different electoral districts.

Table 3 summarizes the spatial features of the expected sample.

Table 3: Spatial sampling scheme (expected)

Area	Dimension	N° interviews	Municipalities/Sample Points	N° interviews per Sample Point
North	Urban	247	5 Metropolis + 12 Other municipalities	10-25 in the Metropolis, 6-12 in the Other municipalities
	Rural	140	23	6
Centre	Urban	142	2 Metropolis + 9 Other municipalities	10-25 in the Metropolis, 6-12 in the Other municipalities
	Rural	34	6	6
South	Urban	335	5 Metropolis + 21 Other municipalities	10-25 in the Metropolis, 6-12 in the Other municipalities
	Rural	102	17	6
	Total	1.000	100	1.000

Table 4 summarizes the spatial features of the effective sample.

Table 4: Spatial sampling scheme (effective)

Area	Dimension	N° interviews	Municipalities/Sample Points	N° interviews per Sample Point
North	Urban	279	5 Metropolis + 12 Other municipalities	10-25 in the Metropolis, 6-12 in the Other municipalities
	Rural	116	23	6
Centre	Urban	127	2 Metropolis + 9 Other municipalities	10-25 in the Metropolis, 6-12 in the Other municipalities
	Rural	33	6	6
South	Urban	334	5 Metropolis + 21 Other municipalities	10-25 in the Metropolis, 6-12 in the Other municipalities
	Rural	100	17	6
	Total	1.000	100	1.000

8.2.4 “Effective” sample size

The effective sample size is composed by 989 young people interviewed. In Table 1 is reported the percentage distribution of the sample.

8.2.5 Type of interview

All the questionnaires were carried out through structured face to face interviews.

8.2.6 Duration of interviews

The mean duration is about 25 minutes.

8.2.7 Overview chart on structure of sample (unweighted data)

		distribution	
		n	%
Total		989	100%
Gender	Female	485	49%
	Male	504	51%

Educational level	1. Inadequately completed elementary education	4	0,4%
	2. Completed (compulsory) elementary education	355	36,1%
	3. (Compulsory) elementary education and basic vocational qualification	66	6,7%
	4. Secondary, intermediate vocational qualification or intermediate general qualification and vocational qualification	42	4,3%
	6. Full general maturity certificates	454	46,1%
	7. Full vocational maturity certificate or general maturity certificate and vocational qualification	9	0,9%
	8. Lower tertiary education	8	0,8%
	9. Higher tertiary education	46	4,7%
TOTAL			100%
Occupational status	in paid work	324	33,5%
	in education	506	52,3%
	in community or military service	15	1,5%
	doing housework, looking after children	4	0,4%
	unemployed	119	12,3%
TOTAL			100%
Living area	Rural area (village/farm/home in the country)	395	40,1%
	Town or small city	284	28,9%
	Urban area (big city/suburbs or outskirts of big city)	305	31%
TOTAL			100%

8.2.8 Response rate

The response rate based on the initial 1000 nominative extracted is about 59%; the totally response rate based on total addresses contacted (1939) is about 51%.

8.3 Field design

8.3.1 Numbers of interviewers

The interviewers engaged for the field work have been 49.

8.3.2 Age and gender distribution of interviewers

As reported in the tables 5 and 6, the gender distribution of the interviewers sample shows a considerable dominance of the female gender (77,6%), while the male gender is less represented (22,4 %).

Table 5: gender distribution

Sex	Frequency	Percent
Male	11	22,4%
Female	38	77,6%
Total	49	100%

Table 6: age distribution

Age	Frequency	Percent
24	1	2,1
25	4	8,3
26	8	16,7
27	4	8,3
28	7	14,6
29	4	8,3
30	7	14,6
31	4	8,3
32	3	6,3
33	1	2,1
34	2	4,2
37	1	2,1
39	1	2,1
42	1	2,1
Total	48	100

The age distribution shows a concentration under 30 years; 27,2% of interviewers are over 30.

8.3.3Number of sampling points

As foreseen by the guidelines, the number of sample point has been 100.

8.3.4 Fieldwork time

The fieldwork was carried out between the 3rd of November and the 10th of December 2004.

8.3.5 Organization of fieldwork: process of data collection

The data collection process has been controlled all the survey time long.

Each week it has been controlled the state of the art of the field work. Each interviewers have received by mail an excel file called “Nominative list” where they could find Code, Name, Surname, Address and, when available, telephone number of the randomly selected young people that should be interviewed.
The extracted nominatives lists were divided into a main list of nominative, which represented the real sample, and a reserve list. Each nominative was divided into more sample layers and for each layer was foreseen a reserve list in the case of the contact effort should not be successful.
Each interviewers had to mail weekly to their coordinator a specifically prepared excel file where he/she should insert the state of the art of the their work.
Further they had to clarify the reason of an eventual refuse by the assigned nominative before passing to the reserve list.
The reason of refusal should be included into the following cases:

- not availability (severe reasons)
- home transfer (well checked)
- impossibility (severe reasons)

Two coordinators remained always telephonically (by mobile phone) at disposal of all the interviewers for any possible problems, requests, doubts could happen during the field work.
The collection of the questionnaires has been organized through the ensured posting system of the Italian Post.

8.3.6 Interviewer briefing

The briefing procedure has been organized as followings.
Three briefing meeting have been organized from the 9th of October 2004 and the 23th of October 2004: one in Bari (south Italy) one in Fano (centre Italy) one in Milan (north Italy).
Almost all the engaged interviewers participate at the meeting. Only 7 of them could not participate; for them it has been organized an on line training with check questionnaire to verify their learning.
The interviewers briefing has been focused on:
1) description on Euyoupart project;
2) specific instruction for the interviewers (how to contact people, how to compile weekly the “nominative list”, how to post the questionnaires, how to use the show cards, etc);
3) the technique of the interview:

- the type of questions and type of answer used in the questionnaire;
- the possible mistakes related to the interviewer, to the interviewees and to the social context where the interview take place;
- the role and the rules of the interviewers;

During the briefing meeting all the prepared material was read and commented.
At the end of the instruction session has been organized a role playing session among the interviewers to allow them to take more confidence with the instrument.

8.3.7 Instruction given to interviewers about the methodology

All the interviewers have been informed about the field work methodology; the explanation was specifically focused on the random sample methodology.

The interviewers were specifically recommended to respect the criteria of correct using the address list.

8.4 Quality control

8.4.1 Measures taken to ensure high quality of the interviews/data

In order to ensure high quality of the interviews/data, some kind of cautions were taken in account.

- It has been designed an accurate sample design, taking care that it would be respected through a reliable sampling procedure.
- It has been organized a well structured briefing with obligatory attendance for all interviewers (see chapter below).
- It has been monitored the interviewers' activity. In particular, each interviewer was provided with the "nominative list" and he had to send each week through e-mail this schedule in which to sign the number of interviews realized (§ 3.5.)
- Interviewers were acknowledged about the final random check. In fact, at the end of the survey, about 15% of the interviews was randomly checked calling the interviewees and asking for some information (if interview was face to face, if interview was full administered and so on).

8.4.2 Analysis of contact protocols

The response rate based on initial 1000 nominative extracted is about 59%; the totally response rate based on total addresses contacted (1939) is about 51%.

8.4.3 Procedures applied to control the interviewers

In order to control the interviewers, we monitored their activity and, when the survey was concluded, a random phone control was carried out on about the 15% of interviewees.

8.4.4 Procedures applied to check the quality of data

Weighting

The sampling plan is classified in:
Geographical area i: 1=North, 2=Centre, 3=South;
Territorial dimension j: 1=North, 2=Centre, 3=South;
Sex k: 1=male, 2=female;
Age l: 1=15-19, 2=20-25.

Totally 24 classes have been created, where the statistic units have been extracted proportionally to the Istat 2003 prospect.
In every class it has been calculated the *expected* number of student and no student, on the base of Multiscopo Istat survey.
In same way it has obtained for the general area i, territorial dimension j, sex k and age l the sum expected:

$ne_{ijklm} = p_{ijklm}\, n_{ijkl}$ con $\Sigma_{ijkl}\, n_{ijkl} = 1000$

where

n_{ijkl} is the number of the unit of *ijkl* layer that results proportional to 1000 unit.

m is the occupational status variable : 1=student, 2= no student;
e p_{ijklm} is the proportion of student/no student inside the layer *ijkl*

The weight of layer *ijkl is:*
$w_{ijklm} = ne_{ijklm} / no_{ijklm}$
where
no_{ijklm} is the number of statistical units of the occupational status *m* observed in the samples
For the calculation it has been considered the question number 38

m = 1 (student) if the interviewee answered 2 in the question 38,
m = 2 (no student) if the interviewee answered differently.
This sampling procedure have also allowed to bring to 1000, the total number of interviews, because the number of the effective interviews is 989.

Data cleaning

The data cleaning has been realized with SPSS through the elaboration of frequency distribution, filter analysis and coherence controls.
The frequency distribution has permitted to verify, variable after variable, eventual data - entry error. For each error it has been controlled the correspondent questionnaire and recode the data with the right answer of interviewer.
The filter questions have been controlled and, in the case of the filter had not been respected, the question that should not be done have been cancelled, lefting the answer blank.
Further the coherence controls have been carried out on socio-personal data.
Specifically the age control has allowed the eligibility to vote control in the last election (Political election 2001, European election).
Regarding the occupational status there is a problem in the question 26.7, in fact many interviewees that answered this question did not answered the question 39 (reporting the work hours) and answered “no” to the question 16; these cases have been forced as 66 “not applicable”.

8.5 Interview situation

8.5.1 Readiness to be interviewed

In general we can report a reasonable readiness to be interviewed among Italian young people. Not all the interviewers found out the same availability, in some cases, especially in the rural area or in the very small town they met few resistances to declare their opinion.

8.5.2 Interference of other person during interview

We recommended during the briefing meeting to avoid the interference of the person during the interview. We expect this recommendation has been observed.

8.6 Difficulty during fieldwork and possible deviations from planned procedures

8.6.1 Feed-back of interviewers

Interviewers did not create any big problems. About the 90% of them was really active, careful and punctual; just about the 10% showed some delays.

8.6.2 Difficulties with realising sample

A difficulty concerned the availability of people aged from 15 to 17 years old. We suppose in some case there were few resistances by the parents. The response rate was more low for this group (about 48%).

8.6.3 Difficulties with weighting

No difficulties were encountered.

8.6.4 Difficulties with data entry and coding

Data entry and coding activity did not generate any problems.

9. Field Report Slovakia

Tel./fax : 00421 2 54412146

9.2 Sample description:

9.2.1 Target population:

Inhabitants of the Slovak Republic aged between 15 up to 25 years.

9.2.2 Description and documentation of sampling strategy and sampling design:

Method of random selection of households.
It's a policy by which is in first step territory of Slovak republic separate at big amount of units, from which are randomly chosen units of observation. From this chosen units are chosen individual households, in second selective step.

Step 1
Separating of Slovakia at territorial units is deduced from number and size of voting districts. In Slovakia exists approximately 5800 voting districts, which are not from the standpoint of number of voters equally big. For the aim of random selection were districts with lower number of voters as 400 attached to closest bigger districts that together didn't overstep standardized number of persons {voters}. The result is structural basic file of approximately 4550 of territorial units.

Step 2
In every of 4550 of territorial units we have created file of addresses in form of name of the streets or specific numbers of houses. Person charged with making a collection of data {interviewer} received assigned addresses {name of the street or numbers of houses in municipality}, in which he will visit households and make an interview.

9.2.3 Procedure of sampling:

For our research was randomly selected 190 territorial units. Every interviewer received file of addresses {name of streets and specific numbers of houses in municipality}.With random walking he visited individual addresses {households}. In this households with random walking {closest date of birthday} he chooses respondents. If in visited households didn't live respondents of target group {age 15-25 years}, he continues with visit of another household.

9.2.4 Effective sample size:

During the field phase were 990 interviews realised. 8 cases of them are incomplete/ not delivered as data file/ . In total n = 982 complete interviews have been delivered as data file.

9.2.5 Type of interwiev:

The survey was conducted face to face, one to one interview, paper and pencil. All interviews were realised in households of respondents.

9.2.6 Duration of interviews:

Generally the duration was significantly shorter than during the pre-test
Maximum:60 minutes
Minimum:35 minutes
Average: 45 minutes

9.2.7 Overview chart on structure of sample – unweighed data

		Number of cases
1.	Interview completed	982
2.	Incomplete interview /started, but will no be completed/	14
3.	Address not usable /e.g. company address, non –exist address, no people living at address/	Not usable for used type of sampling design
4.	It could not be determined whether a target person lives in household / no one available/	Not usable for used type of sampling design
5.	There was not target person /15 – 25 years/ living in this household	423
6.	The target person was not available for more than 4 weeks	Not usable for used type of sampling design
7.	Interview was refused by target person	59
8.	Interview was refused by other person in household	5

We needed 1483 contact efforts to received 982 completed interviews.
66,2% resp.rate

9.3 Field design

9.3.1 Number of interviewers

In total 188 interviewers have been employed. All interviewers are skilled in conducting face to face interview

9.3.2 Age and gender distribution of interviewers

Gender:
Women: 52,7%
Men : 47,3%/

Age	18-24	25-29	30-34	35-39	40-44	45-49	50-54	55-60
Frequency	33	33	22	18	31	18	19	14
Percent	17,6	17,6	11,7	9,6	16,5	9,6	10,1	7,4

9.3.3 Number of sampling points:

The sampling points were selected on the basis of the used sampling model /see the points 2.2. and 2.3./

9.3.4 Process of data collection, organisation of field work

Every one from interviewers had the responsibility to do 6 complete interviews with aim group in destinated locality regarding our briefing instructions.

9.3.5 Information on interviewer briefing, method of briefing

The interviewing instructions were devised and sent by mail to the interviewers with rest of the materials. Instruction covered all need information about the project, instruction for random route, schedule, information about the questionnaire. Interviewers had a chance to ask by phone in agency ASA,s.r.o about points that were unclear to them.

9.3.6 Instruction that were given for the random route procedure

Instruction for the random route procedure and contact forms/protocol/3.6/

Number of interviewer .....
Name of municipality:.....
Name of streets + numbers of houses:.....

1. With random route you choose address /flat, house/ in chosen streets. You start your walking in chosen street at any number. If the numbers of houses are not clarified, choose with random route some of numbers in the chosen street.
2. In selected house, flat you will work with standard way /request, finding of present of aim person in age 15 to 25 years, receiving of agreement for realisation of interview.
3. In case of the present of more persons from aim group make an interview with person, which has birthday in the closest date.
4. Make interview by standard course. In case that in visited household do not live aimed person in age from 15 to 25 years, repeat the procedure of random route of house, flat by preceded numbers of this instructions 1 till 3. If in household is not aimed person just in the concrete moment of your visit, make a term, which will let you to do an appointment with her by repeated visit of this household.
5. Procedure of random route repeat till the finishing of the fixed numbers of interviews.
6. After finishing of every interview you will write down contact address of respondent for the purpose of back control of your work.

Record of contact adress by each completed interview:			Number of cases
	Name and surname	Adress	Telephone number
1.			
2.			
3.			

Record about interview: /fulfil by every contact – refusing also completed interview/ with person from target group .		Number of cases
1.	Interview was completed	
2.	Incomplete interview /started, but will no be completed/	
3.	There was not target person /15 – 25 years/ living in this household	
4.	Interview was refused by target person	
5.	Interview was refused by other person in household	

9.4 Quality control

9.4.1 Measures taken to ensure high quality of the interviews data

The control of the quality the interviews was made randomly. Each interwiever provided name, surname, address and telephone number of all the interviewed persons. Deep and personal brief on all the interviewers, written instructions to all of them.

9.4.2 Procedures applied to control the interviewers.

It was used the written or telephone call back check by 15 % randomly chosen interviews. /All interviews by the 15 % randomly checked interviewers /. Control used questions to check if the interwiev was conducted as specified in protocol and contact form.

9.4.3 Measures/procedures applied to check quality of data

All questionnaires were checked by staff who look after incomplete information or other inconsistencies in interviewing work .Codification of data was made in double, to ensure quality of it.

9.5 Interview situation

Interview was refused with aimed person together in 59 cases, and in 5 cases by other person presented by interview. Percentage of refused we valued as low, doesnt overcross 10%.
Presence of other person during interview or agreement from parents for people under age voting were standard and obviously.Parents present in the same space during the interview had influence in the some question. Especialy by Q21,Q23.

9.6 Difficulties during fieldwork

In Slovak Republic, it is not possible to access to a central person register to draw the sample and to get addresses. We have to use random walk /random route procedure/based on a random sample points / 188 sample points.

Email: gareth.barton@mruk.co.uk

10.2 Sample

10.2.1 Target Population

The target population for the main EUYOUPART UK Survey was young people (both males and females) aged 15 – 25 years old. The survey was conducted across the UK in England, Scotland, Wales, and Northern Ireland.

10.2.2 Sampling Strategy

Unlike the pre-test survey, no quotas were applied during the main survey to ensure the best chance of achieving a random sample. However, loose quotas on each county were applied to ensure that the number of interviews achieved per area was representative of that area's share of the UK 16 – 25 year old population.

200 random 'start' addresses were provided across 68 former counties in England, Scotland, Wales and Northern Ireland. The starting address was where each interviewer attempted the first interview. Thereafter they followed a set of rules to locate other addresses. The interviewer requested an interview at every 5th address in the street, alternatively turning left and right into other streets wherever they are encountered. This ensures a random sample.

The interviewing was scheduled to cover three time bands; weekday daytimes, weekday evenings and weekends, to ensure an appropriate mix of working and non-working respondents are included.

A system of three callbacks was incorporated for those addresses where no one was at home when the interviewer first called.

10.2.3 Interviewing

A total of 999 (Vs target of 1,000) face-to-face, in-home interviews were conducted.
The average interview length is unknown, as this information was not recorded in the main survey. However, based on an internal pilot of 10 interviews conducted prior to the main survey fieldwork commencing, interviews were around 30 minutes in length.
The overall, un-weighted achieved sample was as follows:

	Number of Interviews (n)	**Share of total sample (%)**
Total	*1,000*	*100*
Area - Country level		
England	830	83
Scotland	90	9
Wales	50	5
Northern Ireland	30	3
Age*		
15-17	281	28
18-19	223	22
20-25	495	50
Gender**		
Male	461	47
Female	524	53
Activity Status***		
In Paid Work	396	40
In Education	359	36
Unemployed and in training	13	1
Unemployed	100	10
Permanently sick / disabled	4	0.4
In housework	113	11
Other (unspecified)	9	1
Qualifications (Casmin)****		
1. Incomplete elementary	47	5
2. Completed elementary	104	11
3. Elementary AND basic vocational	483	49
4. interm. Vocational OR interm. General AND vocational	44	5
5. interm. General – not applicable – omitted[+]	19	2
6. full general maturity	150	15
7. full vocational maturity OR general maturity AND vocational	20	2
8. lower tertiary	28	3
9. higher tertiary	48	5
77 Don't Know	20	2
88 Answer Refused	18	2

* 1 missing value reported.
**15 missing values reported.
***18 missing values reported.
****19 missing values reported.

[+] The code for 'Intermediate – General' was omitted as the equivalent qualification level in the UK (GCSEs / O-levels / Standard Grades in Scotland) could be included within Code 3 – All those completing elementary education in the UK will have studied for GCSEs / Standard Grades in addition to any Vocational qualifications.

It is thus possible that the 19 responses within Code 5 are either migrants who studied outwith the UK or have been included in error.

10.3 Field Design

Number of interviewers: 92

Field time: 30/10/04 – 30/11/04

Organisation: The main study was carried out by our interviewers supported by Area Managers and Senior Interviewers. Each reported back to our Head Office Field Manager who in turn reported to Project Manager/Executive.

Briefing: A short verbal briefing by telephone was supported by a written briefing document.*

Age/gender of interviews:	19 male, 73 female
	21 – 35 = 10
	36 – 45 = 14
	46 – 55 = 37
	56+ = 31

* The briefing document provided to interviewers along with editing / analysis staff contained the following information:

- Instructions on completion of the Interviewer questions (interviewers)
- Information on use of codes for Non-Response: "Don't know" (DK), "answer refused" (AR), and "not applicable" (NA) as provided by SORA following the pre-test survey
- Instructions on coding missing values (editing and analysis staff)

10.4 Quality Control

10.4.1 Quality Control in Field

We are IQCS (Interviewer Quality Control Scheme) accredited. This involves the following measures:

- 10% of interviews on every project are validated by telephone to ensure the interview was completed & all questions asked
- Interviewers are accompanied at least twice every year or every 5th project if they work for us infrequently

- Interviewers progress is monitored by the Area Manager who reports back to the Field Project Manager
- New interviewers undergo an extensive 2 day training session
- We receive an annual inspection of our systems and protocols from IQCS

IQCS is the highest confirmation in quality control available in the UK. This process was applied to both the pilot and main studies.

10.4.2 Quality Control in Data Processing and Analysis

During the editing process the following are checked:

- Routing
- Sense of answers
- Blank entries
- Single code & multi code completed correctly

The validation process includes a series of range and logic checks that would incorporate:

- Checking base size against routings
- Checking for blank entries

Logic checks e.g. date of birth against age / working status etc were also conducted. As instructed within the fieldwork guidelines any missing values were not corrected during the editing and analysis processes.

10.5 Difficulties

Overall, there were some difficulties experienced in re-weighting the survey data by 5 different variables (age, gender, region, working status and qualification level). We discovered that our analysis software SPSS did not allow for simultaneous weighting of 5 variables.

With guidance and assistance from Günther Ogris at the SORA Institute for Social Research and Analysis, we were able to weight data on a step-by-step basis.

The population data used for comparison with the Survey data was sourced from the UK Census 2001 results.

The form weight check document showing un-weighted and weighted figures for the 5 key variables within the survey data has been provided along with this document.

11. Weighing procedure

Each national data set needed to contain a country-specific weight. This weight needed to be computed by the field institute to improve the representativity of the sample.

The following standard criteria should have been observed when controlling the data for weighting needs:

- age distribution in sample
- gender
- educational level
- employment status (in education/ working)
- regional distribution
- other criteria if relevant in your country (e.g. minorities)

The each national weight was integrated in the data (variable name “Weight” defined in syntax)

The lead partner was in charge of controlling and correcting weight. In order to control and check the weighting procedure of each partner, we asked the field institutes to describe the weight they had constructed in the field report and to fill a “Weight form”.
The fulfilled weight forms of each partner are enclosed in this section.

In addition, we adjusted all real sample sizes to a standardised sample size of n = 1000/ country in the weight variable. With this procedure we would have equal sample sizes when we compare the countries during the analysis of data.

In order to obtain this standardised sample size, we built a “Final weight” which combines each national weight and adjusts N to 1000 for each national sample.

The procedure to build this “Final weight” is the following (SPPS syntax used)

```
* BUILDING OF A « FINAL WEIGHT » IN ORDER ALL COUNTRIES TO BE STRICTLY COMPARABLE
* N=1000.
compute weiFinal=0.
if (country=1) weiFinal=((1000*weightat)/1007).
if (country=2) weiFinal=((1000*weightet)/997).
if (country=3) weiFinal=((1000*weightfi)/1008).
if (country=4) weiFinal=((1000*weightfr)/1010).
if (country=5) weiFinal=((1000*weightde)/1037).
if (country=6) weiFinal=((1000*weightit)/989).
if (country=7) weiFinal=((1000*weightsk)/982).
if (country=8) weiFinal=((1000*weightgb)/1000).
```

Frequency after weiFinal is activated :

Country

		Fréquence	Pour cent	Pourcentage valide	Pourcentage cumulé
Valide	1 Austria	1001	12,5	12,5	12,5
	2 Estonia	1000	12,5	12,5	25,0
	3 Finland	1000	12,5	12,5	37,5
	4 France	1000	12,5	12,5	49,9
	5 Germany	1000	12,5	12,5	62,4
	6 Italy	1011	12,6	12,6	75,0
	7 Slovakia	1000	12,5	12,5	87,5
	8 UK	1000	12,5	12,5	100,0
	Total	8012	100,0	100,0	

In the guidelines for the Field Work we asked field institutes to respect a defined truncation of weights: weights larger than 2,0 or smaller 0,5 should have not been advisable and should have been avoided.
Unfortunately, due to some problems with the British sample and weighting procedure, we had to accept larger and smaller weight.
At the end, weights go from 0,38 to 2,58. If we except the British data, all weights go from 0,49 (France) to 2,03 (Finland)

11.8 Weight Form Great Britain

Country: UK
Field Institute: **mruk** research
Contact Person for data set: Gareth Barton (Overall project manager)
Email: gareth@mruk.co.uk

Sample size (unweighted): 1000
Sample size (weighted): 1000

Type of sample: quasi random sampling consisting of 200 start points across 68 former county areas in the UK (including England, Scotland, Wales and Northern Ireland).

Table 1 : Gender _ Education level

(column percentages)			**Sample**	
Socio-demographic Characteristics	**Population - Census 2001 Data**		**not weighted %**	**completely weighted %**
Gender (Q33)				
Male	*50*		47	49.1
Female	*50*		53	50.1
Age 4 (Q34)				
15-17	*28*		28	28
18-19	*18*		22	15.8
20-25	*54*		50	56.1
Education level (according to Casmin scale) (Q41)	**Census Equivalent***			
1: incomplete elementary	Casmin scale not available in Census**		15.4	8.5
2: completed elementary	*Same*	*9*		
3: elementary and basic vocational AND interm. General	*Level 1, 2*	*41*	53.7	47.4
4: secondary, interm. Vocational or interm. General *plus* vocational				
5: omitted – GCSEs included in code 3				
6: full general maturity	*Level 3*	*26*	19.2	23
7: full. Vocational maturity or general maturity plus vocational				
8: lower tertiary	*Level 4 / 5*	*24*	7.8	15.4
9: higher tertiary				
'Don't Know' responses in survey	Not applicable		2	4
'Refused' responses in survey			1.8	1.8

***Qualification – Census (Level 1, 2 etc) Vs Survey Classifications**

No qualifications = same as survey

Level 1:GCSE (grades D-G), CSE (grades 2-5), 1-4 CSEs (grade 1), 1-4 GCSEs (grades A-C), 1-4 'O-Level passes, NVQ level 1, GNVQ Foundation or equivalents, BTEC general certificates, **SCOTLAND**: 'O' grades, standard grades, Intermediate 1, Intermediate 2, City and Guilds Craft, SVQ Level 1 or 2.

Level 2: 5+ CSEs (grade 1), 5= GCSEs (grades A-C), 5+ O-Level passes, Senior Certificate, 1 'A Level', 1-3 AS-Levels, Advanced Senior Certificate, NVQ Level 2, GNVQ Intermediate or equivalents, RSA diplomas, city and guilds craft, BTEC Firsts or trade apprenticeships
SCOTLAND: Higher Grade, CSYS, ONC, OND, City and Guilds Advanced Craft, RSA Advanced Diploma, SVQ Level 3

Level 3: 2 + A Levels, 4 + AS levels, NVQ level 3, GNVQ Advanced or equivalents, RSA Advanced Diploma, BTEC Nationals, ONC/ONDs, City and Guilds Advanced Craft or trade apprenticeships
SCOTLAND: HND, HNC, RSA Higher Diploma, SVQ Level 4 or 5

Level 4: First Degree, NVQ level 4, HNC, HND or equivalents, teaching and nursing certificates

Level 5: Higher degree, NVQ level 5 or equivalents

**Census does not provide data for 15 year olds

Table 2 : Employment status

(column percentages)			Sample	
Socio-demographic Characteristics	**Population - Census 2001 Data**	**not weighted %**	**weighted to correct design effects only**	**completely weighted %**
Employment status (Q38)***	**16 – 25 yrs old**	**15 – 25 years old**	**Census data corrected to include 15 year olds (in education)**	
In paid work (employed, self-employed, working for your family business)	*52*	39.8	47	44.9
In education	*38*	36.1	44	42.1
Unemployed and in a training program for unemployed people	-	1.3	-	0.9
Unemployed	*5*	10.1	4.5	5.5
Permanently sick or disabled	*1*	0.4	0.9	0.2
In community or military service	-	-	-	-
Doing housework, looking after children or other persons	*4*	11.4	3.6	6
Other	-	0.9	-	0.4

****** = Census Data Only Available For 16 – 25 year olds Vs 15 – 25 year olds in Survey**

Table 3 : Regional distribution

(column percentages)		Sample		
Socio-demographic Characteristics	**Population - Census 2001 Data**	**not weighted %**	**weighted to correct design effects only**	**completely weighted %**
Regional distribution****				
WALES	***4.9***	**4.9**	-	5.3

N / A = Data unavailable for percentage share of total UK 15 – 25 year old population within Scotland and Wales – this is only available at a Country level (i.e. Scotland, Wales). Within the survey interviews were not conducted in the following areas due to the very low share of the population:

Area	% Share of Total UK population (2003 estimate)
Borders (Scotland)	0.18
Dumfries & Galloway (Scotland)	0.25
Isle of Wight (England)	0.23
Orkney (Scotland)	0.03
Powys (Wales)	0.21
Shetland (Scotland)	0.04
Western Isles (Scotland)	0.04
