ANONYMISATION PLAN FOR PROJECT DISCULTHER

Research project description:

DICULTHER - Digitalization of Cultural Heritage as Discursive Practice: Mapping the Museums and Citizens-led Initiatives in Graz and Novi Sad is a research project that is supported by the Marie Sklodowska Curie Action Programme of the European Union in the form of individual research fellowships.[1] The present study explores the manner in which the process of digitalizing cultural heritage is expressed through discourse. The primary data source for the project is derived from interviews with experts and activists from museums and cultural organizations who are engaged in the field of cultural heritage digitalization, protection and research. In the interviews, they express their opinions and attitudes towards digitalization, particularly digitalization of cultural heritage in museums and other cultural institutions, preservation, protection and promotion of heritage, etc. The methodological framework for data collection and analysis is the situational analysis, a qualitative methodological framework and approach.

Anonymisation:

There are no direct identifiers in the transcribed data and no sensitive information. All interviewees agreed to do interviews and transcripts to be kept and available for future research. Anonymised data are marked with []. Data that could not be anonymised – for example, whole sentences, or additional explanations that are not necessary, are deleted and marked with (...). Anonymisation techniques are used for the following identifiers:

Names
The transcripts of the interviews do not contain names. For consistency, [P] (participant) is used for interviewed persons and [I] (interviewer) for interviewing person. The abbreviation [P] is numbered according to the order of the interviews, s [P] from interview 1 is called [P1], [P] from interview 2 is called [P2], etc. All other personal names mentioned, for instance the names of the collaborators or other colleagues in the projects or institution are kept just as generic data. For example, the artist (Name and Surname) is left just as the artist, Name and Surname of the colleague is just a colleague, etc.
Justification: personal names of collaborators are indirect identifiers and could be related to the interviewees.

Gender
Gender of the interviewees are anonymized only in the transcripts in Serbian language. In the interviews conducted in English it is not recognizable anyway. However, gender dimension of gathered data and analysis is very important for this project and is recognizable in the content. Justification: gender of the interviewee is not relevant for the research topic, but as an indirect identifier, it could be used as specific contextual information for re-identification.

Location information
Just the general locations information is left. Those are names of the cities and countries where these interviews were conducted. Other names of locations as indirect identifiers, like the cities or places of partners, projects, colleagues, etc. are anonymized as "other cities" or "other states" when mentioned.
Justification: The combination of location and indication of country could be used as specific contextual information for re-identification.

Institutions and organizations
Names of the institutions and organizations where experts, activists or researchers work is anonymized with pronouns or with impersonally, just with nouns. For example, "in this institution/organization".
Justification: The combination of name of institution and indication of country could be used as specific contextual information for re-identification.

Research projects
Projects and collaborations mentioned by their title/name are just left as "projects" and/or "collaborations".
Justification: The combination of project name and indication of country could be used as specific contextual information for re-identification.
