StORe Wars

May the Source and its Outputs be with you!

Graham Pryor & Ken Miller

StORe Wars

May the Source and its Outputs be with you!

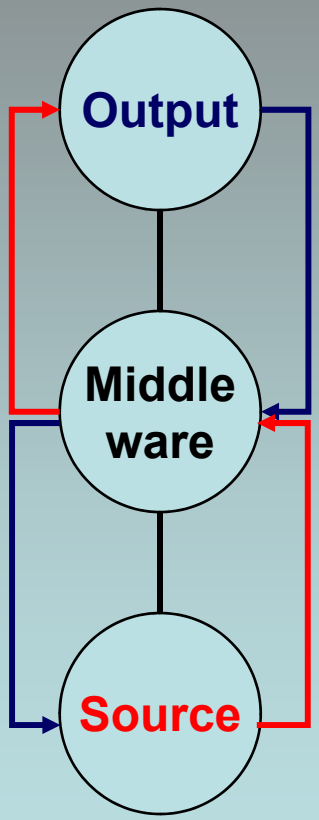
Graham Pryor & Ken Miller

StORe Log, May 16 2007

- The mission
- Explorations and discoveries
- A charted course
- Into the Web
- Secure and control
- Bi-directional transports
- A new hope

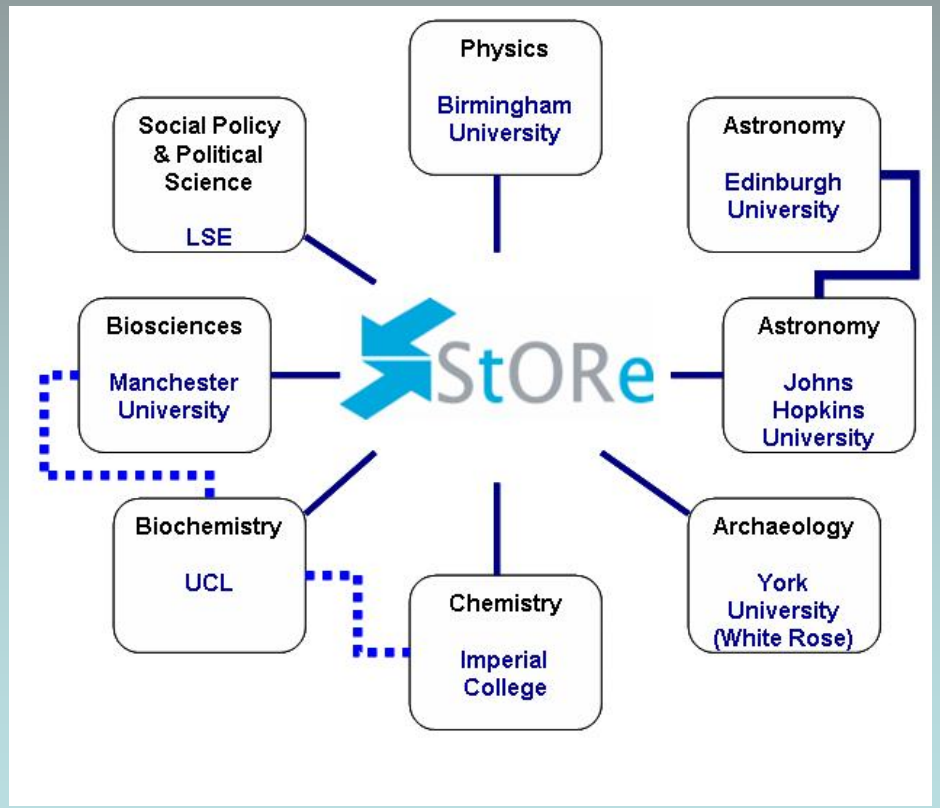
Mission

- Seamless transport from research data to research publications and vice versa
- Bi-directional links proven in social science e-research
- Capable of export to other domains



Explorations and discoveries

SURVEY OF SEVEN DOMAINS - 1



Questionnaire and interviews

- Self sufficiency
- Risky data management practices
- Recognition of the value and demands of metadata
- Support for open access principle
- Caution over data access and ownership
- Personal networking

Explorations and discoveries

SURVEY OF SEVEN DOMAINS - 2

Opportunities to

- Explore a deeper level of detail
- Validate experiments (*viz Chang's nightmare)*
- Track the use and improvement of research output
- Identify collaborators
- Confirm completeness of information searches
- Supplement published papers

Potential risks from

- Uncertainty of peer review
- Premature dissemination
- Subversion of scholarly paper
- Scavenging
- Lack of interpretative data

Explorations and discoveries

SURVEY OF SEVEN DOMAINS - 3

Sufficient consensus to proceed with design

- Two-way links endorsed as advantageous (85%)
- Need to avoid bureaucratic structures and rules
- Sharing of data a fundamental principle but usually conducted on an individual basis
- Need simplicity and standards for metadata
- Simple Google-type searching preferred
- Self-management preferred to intermediation

A charted course

- Web 2.0 approach, similar to services like Flickr or MySpace, gives control to the researcher
  - Researchers determine which items are public / private
  - Researchers form collaborations with colleagues / 'friends'
  - Researchers select items for deposit and for publication
- Permanent links created between publications and underlying data
- Based on federations of institutional repositories and data archives
- Simple process for assignment of metadata
  - Searchable metadata assigned at collection level inherited by items within the collection
  - Collection owners add individual items plus minimum additional metadata (e.g. titles)
