Introduction

The COVID-19 pandemic has dealt a heavy blow to many people's lives and interrupted their normal course of life. The present panel study thus examines the impact these changes have upon people's values and attitudes concerning work, partnership and models of femininity, politics, solidarity, and religion.

The first wave of the Special COVID-19-edition was collected online in December 2021 in Austria, during the fourth wave of the pandemic, the second wave was collected in September/October 2022, while the pandemic has intermittently calmed down.

Both waves contain, besides a main sample (n in wave 1 = 1,560, n in wave 2 = 1,533), an additional youth oversample of people aged between 14 and 25 (n in wave 1 = 551, n in wave 2 = 569). This is to say that, due to the oversamples, ***the data set must not be used without applying poststratification weighting!***

The Special COVID-19-edition can be analysed alone or in synopsis with the data from previous European Values Studies, in particular with the data from the European Values Study 2018 (EVS 2018),[1] which was the last EVS conducted before the onset of the pandemic. The accompanying STATA-script aids the user in merging the two data sets, the EVS 2018 and the present EVS 2021-2022, to subsequently allow for comparative analyses at the aggregate level and for tracking changes across this very time span that saw the arrival of the COVID-19 pandemic.

Fieldwork

The fieldwork was carried out by

Marketagent.com online reSEARCH GmbH
Mühlgasse 59
2500 Baden

Researchers

The present study was undertaken by the Interdisciplinary Research Network on Values, located at the University of Vienna (in alphabetic order):

Christian Friesl (Principal Investigator), Department of Practical Theology, University of Vienna
Sylvia Kritzinger (Principal Investigator), Department of Government, University of Vienna
Regina Polak, Department of Practical Theology, University of Vienna
Markus Pollak, Department of Government, University of Vienna
Patrick Rohs, Department of Practical Theology, University of Vienna
Johanna Willmann, Department of Government and Department of Practical Theology, University of Vienna

Topics / keywords

Values: work, family, partnership and femininity, environmental, moral, political, religious, COVID-19, youth oversample, Austria.

Study Design

Sampling

Eligibility and Oversample

The study contains two samples: a main sample that is representative for the Austrian population as well as an oversample of young people (youth oversample).

For the main sample, all people from 14 to 75 years living in Austria were eligible to participate in the survey. For the youth oversample, people aged between 14 and 25 years living in Austria were eligible to participate in the survey. Respondents were sampled from a pre-existing online panel of Marketagent.com and chosen to match the Austrian population on gender, age, province, and education.

Invitation of respondents

Initially, during the first two weeks in each wave (between December 3rd and December 14th, 2021, and between September 16th and October 2nd, 2022, respectively), invitations were sent out to respondents who were sampled for the main sample. Later, during about the third and last week of the field period (between December 15th and December 20th, 2021, and between October 3rd and October 8th, 2022), invitations were sent out only to participants sampled for the oversample. In the first wave, more invitations were sent out than in the second wave, while in the second wave the emphasis was on sending out reminders to ensure highest possible panel participation.

Invitations in wave one:

	Date	Amount of invitations	Amount of reminders
Main sample:			
	12/3/2021	1,500	
	12/5/2021	500	
	12/7/2022	3,522	
	12/8/2021	4,510	
	12/9/2021	4,369	
	12/10/2021	4,152	
	12/11/2021	4,663	
	12/12/2021	4,343	
	12/13/2021	764	
	12/14/2021	100	
		TOTAL: 28,423	
Oversample (14-25 years):			
	12/15/2021	3,000	
	12/16/2021	4,000	
	12/17/2021	2,023	
	12/19/2021	2,107	8,249 (male, 14-25 years)
	12/20/2021	1,000	
		TOTAL: 12,130	
		TOTAL (main and oversample): 40,553	

Invitations in wave two:

	Date	Amount of invitations	Participants	Amount of reminders
Main sample:				
	9/16/2022	200	Panelists from wave 1	114
	9/19/2022	676	Panelists from wave 1	388
	9/20/2022	951	Panelists from wave 1	559
	9/23/2022	1,280	Fresh respondents	230
	9/26/2022	950	Fresh respondents	205
	9/27/2022	5,200	Fresh respondents	1,353
	9/28/2022	5,009	Fresh respondents	878
	9/29/2022	2,150	Fresh respondents	484
	9/30/2022	1,141	Fresh respondents	241
	10/2/2022	456	Fresh respondents	417
		TOTAL: 18,013	**TOTAL:**	**4,869**
Oversample (14-25 years):				
	10/3/2022	3,619	Fresh respondents	2,047
	10/4/2022	4,000	Fresh respondents	1,965
	10/5/2022	1,905	Fresh respondents	1,861
	10/6/2022	19	Fresh respondents	4
	10/7/2022	2,006	Fresh respondents	
		TOTAL: 12,353	**TOTAL:**	**5,877**
		TOTAL (main and oversample): 30,366	**TOTAL:**	**10,746**

Response rates

Of the 40,553 invitations that were sent out to eligible participants in the first wave, 2,213 surveys were completed (5,5%), out of which 102 had to be deactivated by the polling institution due to contradictions in their response patterns or extreme speeding, resulting in a total of 2,111 interviews in the data set (n=1,560 from the main sample and n=551 from the oversample). For the second wave, 1,827 respondents from the first wave were re-invited to participate, 260 respondents did not qualify for re-invitation because they had either missed both attention check items in the first round, or they had indicated more than 100 times “don’t know” or “no answer” in the first survey.

From the 1,827 re-invited panelists, 1,107 chose to participate again (60,6%). Unfortunately, 17 interviews hat to be deactivated by the polling institution due to abnormalities in their response patterns or extreme speeding, resulting in a panel component of 1,090 respondents. In addition, 28,539 invitations were sent out to fresh respondents, to make up for panel attrition, out of which 1,059 surveys were completed (3.7%). As before, 47 interviews had to be deactivated by the polling institution, resulting in 1,012 fresh interviews in wave 2.

In a nutshell, the panel participation is as follows:

1021 respondents participated only in wave 1
1012 respondents participated only in wave 2
1090 respondents participated in both waves

Fieldwork

The fieldwork of the first wave was carried out between December 3 and December 21, 2021, during the fourth wave of the pandemic, and the fieldwork of the second wave was carried out between September 16 and October 9, 2022, during a period in which the pandemic had cooled down.

Mode

The surveys were conducted online (CAWI).

Duration of interviews

In the first wave, the median duration of the survey was 28 minutes for respondents beyond the age of 25 years. Younger respondents, up to the age of 25, who had 8 more questions to answer (cf. skipping pattern in the questionnaire), had a median duration for completing the survey of only 25 minutes.

In the second wave, fresh respondents beyond the age of 25 years completed the survey in a median time of 25 minutes, while it took fresh young respondents, up to the age of 25 years, a median time of 22 minutes to complete the survey – again, despite a slightly longer questionnaire.

Panelists beyond from the first wave, who did not have to re-answer 8 sociodemographic questions, had a median duration of 26 minutes in the second wave.

Participants' gratification

Participants received a gratification of 2 Euro in each wave.

Compatibility with previous waves

The EVS Special Edition 2021 is in continuity with previous European Values Surveys, and thus contains a subset of the questions that were usually asked in the European Values Surveys, in particular in the EVS 2018, plus a few additional questions. Therefore, it is possible to compare the EVS surveys, including the Special COVID-19-edition 2021-22, at *the aggregate level* across time.

To facilitate the comparison between the Special COVID-19-edition 2021-22 and the EVS 2018 (as a pre-COVID benchmark), a STATA-script is included in the download of the data set that is meant to help the user with linking the two data sets. The script harmonizes the variable names of the two data sets and appends the cases from the EVS 2018 to the Special COVID-19-edition. It is important to notice, however, that the EVS 2018 is not part of the current panel, since the respondents in both studies do not overlap but form two independent samples.

Data Cleaning

Variable naming convention

The stem of each variable name is their number in the questionnaire, e.g., Q1, Q2, Q3. If a question contained several sub-questions (e.g., How important are the following areas in your life: work, family, friends, leisure time, politics, and religion?), they are listed as Q11A, Q11B, Q11C, etc.

In addition, a suffix indicates in which survey or wave the question was posed. E.g., Q1_w1 indicates that the question was asked in wave 1, Q1_w2 indicates that the question was asked (again) in wave 2. In case the data from the EVS 2018 are appended via the STATA-script included in the download of the current data set, Q1_2018 will indicate that the is available for 2018 as well.

Variables without any suffix were posed to all respondents in the first round and only to fresh respondents in the second round and thus exist only once for each respondent.

Missing Values:

. = Was not asked in that particular wave

77 = “Not applicable”

88 = “Don’t know”

99 = “No answer”

Disclosure edits

To protect participants’ privacy and anonymity, the following recodings were implemented:

<u>Q2 (Gender)</u>

Answer option “divers”, which had only a few cases, was collapsed with “no answer”.

<u>Q3 (Year of Birth)</u>

Years 2005 to 2008 were bottom-coded to “2005 and younger”, and years 1946 to 1949 were top-coded to “1949 and older”.

<u>Q5, Q6, Q113, Q114 (Education of self; expected education of self [if respondent was <=25 years]; education of father; education of mother)</u>

Categories a (“Volksschule oder weniger”) and b (“Hauptschule oder AHS Unterstufe”) were collapsed to form one single category (“Hauptschule, AHS Unterstufe oder weniger”)

Q7A1, Q8A1 (People living in household; People <18 years living in household)

If respondents indicated more than 7 people living in the household, they were top-coded to “7 or more people living in the household”. If respondents indicated more than 4 people under 18 years living in the household, they were as well top-coded to “4 or more people <18 living in the household”.

Q9 (Living together with parents [if respondent was <=25 years])

A new variable Q9a was created, where categories a (“Yes, with both parents”) and b (“Yes, with one parent”) were collapsed to form one single category (“Yes, with one or both parents”).

Q25 (Religious denomination)

Category e (“Alevi religious communion”) was collapsed with category g (“other”).

Q40A1 – Q40A14 (Open-ended question, participation in various demonstrations)

In Q40a (open-ended question), respondents were invited to list other demonstrations in which they participated or would potentially participate beyond the ones mentioned in Q40A1 – Q40A14. If respondents indicated demonstrations in Q40a for which there was actually a response option offered in Q40A1 – Q40A14, then Q40A1 – Q40A14 were recoded accordingly to resemble participation in the respective demonstration. E.g., if a respondent typed “black lives matter” in the textbox in Q40a, then Q40A4 (“Demonstration for the rights of refugees or foreigners or against racism”) was recoded for this respondent to 1 (“did mention”).

Q97, Q98, Q99 (Country of Birth)

Countries with fewer than 20 cases were collapsed. For variable Q97 (respondent’s country of birth), this means that answer options “Turkey”, “Poland”, “Czech Republic”, “Hungary” and “Russia” were recoded to category “other”; “Bosnia”, “Croatia”, “Serbia”, and “Slovenia” were collapsed to form category 4 “BKS”. For variables Q98 and Q99 (father’s and mother’s countries of birth), categories “Croatia” and “Slovenia” were collapsed, as were categories “Poland” and “Czech Republic”; answer option “Russia” as recoded to category “other”.

In addition, dichotomous variables Q97a, Q98a, and Q99a, denoting whether self, father, or mother was born in Austria or abroad, were created that are compatible with EVS 2008.

Q110 (Open-ended question, relationship with other person)

Disclosure edits of the open-ended answers have been undertaken to protect respondent’s anonymity, where necessary, and are indicated accordingly by the tag “[REDACTED]”.

Derived variables for users' convenience

"alter" – *age of respondent in years, Q3*

"youth" – *dummy variable indicating whether respondent is <= 25 years (1) or above (0)*

"edu" – *highest level of education of respondent, ordered from least to highest level, Q5*

"edu_exp" – *expected education if respondent is <=25 years, ordered from least to highest level, Q6*

"edudad" – *father's highest level of education, ordered from least to highest level, Q113*

"edumum" – *mother's highest level of education, ordered from least to highest level, Q114*

"mig" – *dummy variable indicating migration background: whether respondents themselves or both their parents were born abroad, Q97-Q99*

"pm" – *postmaterialist index, Q54-Q57: +2 points if first choice is postmaterialist, +1 point if second choice is postmaterialist, -2 points if first choice is materialist, -1 point if second choice is materialist*

"inattentive" – *variable indicating on how many of the two attention check items (Q62A7 and Q89A14) respondents missed out (see "Data quality" below for more details).*

"contradiction" – *variable flagging inconsistent response behavior: contradicting gender (Q2_w1 and Q2_w2), year of birth (Q3_w1 and Q3_w2), or country of birth across waves (Q97_w1 and Q97_w2), or indication of a vote recall of self-declared non-nationals (Q71_w1 and Q72_w1) (see "Inconsistent response behavior" below for more details).*

Data protection and pseudonymization

Where necessary, variables were recoded as described above. Information on postal code was removed. In addition, entries in the open-ended questions Q40a and Q110 were checked and partly deidentified (see Q110 above) and do not contain any personal information that allowed for respondents' identification.

Data quality – attention check items

To detect careless responding, two attention check items were included in each survey (Q62A7 and Q89A14). Both items were part of a longer battery of questions and both items asked respondents to check the box for "no answer", instead of providing a substantial answer. The variable "inattentive" indicates the number of missed attention check items. In the first wave, 1,778 respondents did not miss any of the attention checks, 121 respondents (=5.73%) missed one attention check item and 212 respondents (=10.04%) missed both attention checks. Those latter 212 respondents were not re-invited to participate in the second wave, where 1,757 respondents did not miss any of the attention checks, 120 respondents (5.71%) missed one item, and 225 respondents (10.70%) missed both attention checks.

As will be explained in more detail below, weights are provided that adjust for respondents who missed both attention check items, since they have a different socio-demographic background on average (e.g., younger, male).

Inconsistent response behavior

Generally, panelists had to respond to socio-demographics only in wave 1. Some – frequently unmovable – socio-demographics were, however, questioned in both waves to monitor the reliability of response behavior. This applied to gender, age, and country of birth. Thus, we observed that 9 respondents provided contradicting responses regarding their gender across both waves, 54 respondents reported different years of birth across both waves, and 13 respondents reported differing countries of birth across wave one and wave two. Also, we detected 53 respondents in wave 1 and 69 respondents in wave 2, who indicated having cast a vote in the previous national elections but at the same time lacking the Austrian citizenship. All these cases were retained in the data set but flagged by the variable “contradiction” (see “Derived variables” above).

Weighting

On account of the oversampling of young people, which introduces a notable demographic discrepancy to the data set, ***weighting has to be applied for all analyses***. For that reason, the data set provides 16 different stratification weights to serve a variety of analytic needs. All weights were computed using the iterative proportional fitting algorithm (Deming and Stephan 1940),[2] as it was implemented by Bergmann (2011)[3] in STATA. Missing values were imputed with the modal value of the respective variable (modal imputation).

Benchmark values were obtained from STATcube,[4] the statistical database maintained by Statistics Austria. Since religious denomination is no longer part of Statistic Austria's Microcensus, the target population benchmarks were drawn from the distribution of religious denominations from the (weighted) EVS 2018. This comes at the advantage of ensuring comparability of estimates across time.

All weights were computed for respondents from both waves separately and carry accordingly the suffixes _w1 (for respondents from wave one) and _w2 (for respondents from wave two). In addition, for users who want to use the data set as a *balanced* panel, all weights were computed only for respondents who participated in both waves (panelists) and were assigned the suffix _p.

The data set also contains two weights that are suited for comparing data across the EVS Special COVID-19-edition 2021-2022 and the EVS 2018, after having merged both data sets by means of the STATA-script enclosed with the download of this data set. These two weights serve no purpose when using only the EVS Special COVID-19-edition 2021-2022 on its own.

All weights were trimmed to 3, 3.5, 4, 4.5, or 5, depending on their initial range, whereby the goal was to truncate no more than about 2% to 2.5% of the cases.

- 1) For the analysis of the entire data set: *weight_all_w1, weight_all_w2, and weight_all_p*

Weight_all adjusts the entire sample (n=2,111 in wave one; n=2,102 in wave two, n=1,090 in both waves) to the following population benchmarks: gender, age, gender*age, education, education*gender, education*age, occupation, civil status, region, and religious denomination. The target population was confined to the people aged between 14 and 75.

- 1a) For the analysis of the entire data set without inattentive respondents: *weight_a_noi_w1*, *weight_a_noi_w2*, and *weight_a_noi_p* (noi: "no inattentives")

[2] Deming, W. Edwards; Stephan, Frederick F. (1940), On a Least Squares Adjustment of a Sampled Frequency Table When the Expected Marginal Totals Are Known, in: The Annals of Mathematical Statistics 11 (4): 427-444.
[3] Bergmann, Michael (2011), IPFWEIGHT: Stata module to create adjustment weights for surveys, Statistical Software Components S457353, Boston College Department of Economics.
[4] https://www.statistik.at/en/databases/statcube-statistical-database.

As mentioned above, the survey contains two questions measuring respondents' attention. *Weight_a_noi* was prepared analogously to *weight_all* but excludes respondents who missed both attention check issues (n=1,899 in wave one; 1,877 in wave two; n=1,056 in both waves).

- 2) For the analysis of only the main sample (without youth oversample): *weight_main_w1* and *weight_main_w2*

Weight_main adjusts only the main sample (n=1,560 in wave one; n=1,533 in wave two) to the population benchmarks for gender, age, gender*age, education, education*gender, education*age, occupation, civil status, region, and religious denomination.

- 2a) For the analysis of the main sample without inattentive respondents: *weight_m_noi_w1* and *weight_m_noi_w2*

Weight_m_noi was prepared analogously to *weight_main* but excludes respondents who missed both attention checks (n=1,452 in wave one; n=1,466 in wave two).

- 3) For the analysis of the youth only: *weight_youth_w1, weight_youth_w1, weight_youth_p*

Weight_youth weights only the subpopulation of respondents between 14 and 25 years (from the main sample as well as the oversample) (n=806 in wave one; n=803 in wave two; n=270 in both waves) to compensate for differences between the sample and the target population with respect to gender, age, gender*age, education, education*gender, education*age, region, and religious denomination.

- 3a) For the analysis of the youth without inattentive respondents: *weight_y_noi_w1, weight_y_noi_w2, weight_y_noi_p*

Weight_y_noc was prepared analogously to *weight_youth* but excludes respondents who missed both attention check items (n=666 in wave one; n=598 in wave two; n=246 in both waves).

- 4) For analyses involving comparisons between the EVS 2018 and the EVS 2021-2022: *weight_comp_w1* and *weight_comp_w2*

The accompanying STATA-script allows for merging the EVS 2018 and EVS 2021-22 data sets. If this option is chosen, *weight_comp* (or *weight_c_noi*) is to be used for all analyses. **If the data sets are not merged and only respondents from the EVS 2021 are studied, *weight_comp* (or *weight_c_noi*) has no use.**

The combined data sets offer a few challenges for a common poststratification weight, since the two surveys used slightly different research designs. For one, both surveys contain different oversamples. The EVS 2018 contains an oversample of residents with migration background, while the EVS 2021 contains an oversample of young people. For the other, the surveys sampled along

slightly diverging age limits. Respondents from the EVS 2018 were sampled from 18 years on with no upper limit, while respondents from the EVS 2021 were sampled from 14 and 75 years.

To nevertheless allow for comparative analyses of the two data sets, the weight variable *weight_comp* is provided in the combined data set that copes with these peculiarities. For the respondents from the EVS 2018, *weight_comp* corresponds to the original weight variable that is included in the EVS 2018. For the respondents from the EVS 2021-2022, on the other hand, *weight_comp* adjusts the subpopulation of 18- to 75-year old respondents (n=2,244 in wave one; n=2,033 in wave two) to gender, age, gender*age, education, education*gender, education*age, occupation, civil status, region, religious denomination *and migration background*, in analogy to the weighting of the EVS 2018. The target population has thereby been confined to 18-year-old Austrian residents and above (with no upper limit, like in the EVS 2018). To be more specific, the 65- to 75-year-olds in the EVS 2021-22 sample were being weighted up to adjust them to the target population of people aged 65 years and over (with not upper limit, like in the 2018 EVS).

- 4a) For analyses involving comparisons between the EVS 2018 and the EVS 2021 without inattentive respondents: *weight_c_noi_w1* and *weight_c_noi_w2*

Weight_c_noi was prepared in analogy to *weight_comp* but excludes respondents who missed both attention checks (n=1,846 in wave one; n=1,825 in wave two). There is no corresponding weight in the EVS 2018 (which was conducted CAPI). Instead, when merging the two data sets with the enclosed STATA-script, *weight_c_noi_2018* is a clone of *weight_comp_2018*.

List of Variables

Color code of EVS 2021-2022 panel questions:	
Black	*Question was asked in both waves 2021 and 2022*
Green	*Question was asked in first waves 2021 to all respondents, in 2nd wave 2022 only to fresh respondents*
Orange	*Question was asked only in first wave 2021*
Blue	*Question was asked only in second wave 2022*

Administrative variables

Variables from the questionnaire

EVS 2018	EVS panel 2021-2022	
Q2	Q2	Gender
Q3	Q3	Year of birth
Q4	Q4	Region
Q5	Q5	Highest level of education
	Q6	What do you think will your highest level of education one day be
Q7	Q7	Number of people living in household
	Q8	Number of people <18 years living in household
	Q9	Are you living together with your parents
9a	Q9a	Are you living together with your parents (compatible with 2018)
Q10	Q10	Marital status
Q11A1	Q11A1	How important in your life: work
Q11A2	Q11A2	How important in your life: family
Q11A3	Q11A3	How important in your life: friends and acquaintances
Q11A4	Q11A4	How important in your life: leisure time
Q11A5	Q11A5	How important in your life: politics
Q11A6	Q11A6	How important in your life: religion
Q12	Q12	Taking all things together how happy are you
Q13	Q13	Describe your state of health these days
Q14A1	Q14A1	Do you belong to: religious organisation
Q14A2	Q14A2	Do you belong to: cultural activities
Q14A3	Q14A3	Do you belong to: trade unions
Q14A4	Q14A4	Do you belong to: political parties/groups
Q14A5	Q14A5	Do you belong to: environment, ecology, animal rights
Q14A6	Q14A6	Do you belong to: professional associations
Q14A7	Q14A7	Do you belong to: sports/recreation
Q14A8	Q14A8	Do you belong to: charitable/humanitarian organization
Q14A9	Q14A9	Do you belong to: consumer organization
Q14A10	Q14A10	Do you belong to: self-help group, mutual aid group
Q14A11	Q14A11	Do you belong to: other groups
Q14A12	Q14A12	Do you belong to: none
Q15	Q15	Did you do voluntary work in the last 6 months
Q16A1	Q16A1	Don't like as neighbors: people of different race
Q16A2	Q16A2	Don't like as neighbors: heavy drinkers
Q16A3	Q16A3	Don't like as neighbors: immigrants/foreign workers
Q16A4	Q16A4	Don't like as neighbors: drug addicts
Q16A5	Q16A5	Don't like as neighbors: homosexuals
Q16A6	Q16A6	Don't like as neighbors: Christians
Q16A7	Q16A7	Don't like as neighbors: Muslims
Q16A8	Q16A8	Don't like as neighbors: Jews
Q16A9	Q16A9	Don't like as neighbors: gypsies
Q16A10	Q16A10	Don't like as neighbors: I like them all

EVS 2018	EVS panel 2021-2022	
Q17	Q17	People can be trusted/can't be too careful
Q18A1	Q18A1	How much you trust: your family
Q18A2	Q18A2	How much you trust: people in your neighborhood
Q18A3	Q18A3	How much you trust: people you know personally
Q18A4	Q18A4	How much you trust: people you meet for the first time
Q18A5	Q18A5	How much you trust: people of another religion
Q18A6	Q18A6	How much you trust: people of another nationality
Q19	Q19	How much control over your life
Q20	Q20	How satisfied are you with your life
	Q21	Is your situation going to improve in the coming years
Q22A1	Q22A1	Important in a job: good pay
