1. Introduction

This report accompanies the Multi-Mode Panel Study 2017 (doi:10.11587/NXDDPE) conducted by the *Austrian National Election Study* (AUTNES) and provides a detailed documentation of the data collection. The three-wave panel focuses on the Austrian National Parliamentary Election held on 15 October 2017.

1.1 How to cite these data

Data users are kindly asked to acknowledge the data and the accompanying release document (Documentation). Please refer to the Austrian Social Science Data Archive - AUSSDA for a recommendation on how to cite these data.

1.2 Changes in Editions

(No changes.)

2. Conditions of Use

2.1 Restrictions

The data are available for scientific use without restrictions.

2.2 Confidentiality

AUTNES, its Principal Investigators, and the funding institutions neither take responsibility for the use of the data or interpretations and inferences based on their use, nor do they accept liability for indirect, consequential, or incidental damages or losses arising from use of the data.

2.3 Deposit Requirement

In order to facilitate exchange within the scientific community and to provide the funding agencies with essential information about the use of archival resources, users of the AUTNES data are asked to notify the AUTNES team of publications based on its data.

3. Study Description

3.1 Title and Edition

AUTNES Multi-Mode Panel Study 2017 – Documentation (Edition 1.0.0)

3.2 Principal Investigators

Wolfgang C. Müller, Department of Government, University of Vienna (Supply Side)

Sylvia Kritzinger, Department of Government, University of Vienna (Demand Side)

Hajo Boomgaarden, Department of Communication, University of Vienna (Media Side)

3.3 Funding / Acknowledgments

This study was funded by ACIER – *Austrian Cooperative Infrastructure for Electoral Research* financed by the Federal Ministry of Science, Research and Economy (BMWFW) [Scheme: Hochschulraum-Strukturmittel 2016].

3.4 Fieldwork agency

The fieldwork for the AUTNES Multi-Mode Panel Study 2017 was completed by the Institute for Empirical Social Studies (IFES) (Vienna, Austria), Url: https://www.ifes.at/.

3.5 File Names

10025_mr_en_v1_1.pdf (Method report and codebook)
10025_qu_de_v1_0.pdf (Questionnaire German)

3.6 Topics / Keywords

National elections, voting behaviour, mass media use, political systems, political organizations, political efficacy, national identity, social inequality, election campaigns, European Union, political coalitions

4. Study Design

4.1 Sampling

The AUTNES 2017 Multi-Mode Panel Study surveyed respondents with telephone or internet access. In order to participate in the study respondents had to be Austrian citizens and at least 16 years old or eligible to vote on Election Day 2017.

Concerning the telephone mode, respondents were initially contacted in **wave 1** based on a simple random sample by applying the Randomized Last Digit technique. The distributions of region (province), age and education were monitored during the fieldwork. In order to influence the distribution according to region (province) without violating the random sample assumptions, telephone numbers (landlines based on area code, mobile phone numbers in case of their appearance in the phone book) from some regions (provinces) were excluded from the sample during the end of the fieldwork when the targeted number of cases was already reached. When the region could not be identified, numbers were continually contacted nonetheless. This resulted in slight deviations in the regional distribution from the population.

From **wave 2** onwards, respondents from wave 1 were contacted again and offered a 5 euro incentive. In order to increase the number of interviews, respondents who also stated an e-mail address but abstained from participating in wave 2 even after several attempts to get in contact via telephone were deactivated in the telephone sample on October 12 and invited via e-mail to participate in the online survey instead. Out of 90 invited persons, 22 persons finally participated via the online mode.

In **wave 3**, the respondents who participated in both previous waves were initially contacted again (not including the respective 22 respondents, who participated online in wave 2). The remaining respondents (who did not participate in wave 2) were only contacted again beginning on November 2. In order to minimize no-response bias with regards to age, telephone numbers of younger people tended to be contacted earlier.

For the telephone interviews, the following rules applied:

- At least 5 attempt to get in contact
- At least 3 days between the attempts
- Variation of the attempts over time

Concerning the online mode, respondents were recruited from three different sources: i) IFES Online Pool, ii) Market Agent Online Access Panel, and the iii) Meinungsraum Online Access Panel.

i) IFES Online Pool: Respondents' e-mail addresses were recruited offline via CATI und CAPI surveys, which were based on random samples that are representative for the Austrian population. Out of this pool, people were initially invited randomly to participate in the survey.

Later, additional persons were invited for specific age groups. For waves 2 and 3, all respondents were incentivized to participate again.

ii) Market Agent Online Access Panel: Quotas for respondents with respect to gender, age and education were set based on the interviews from the IFES Online Pool. The regional distribution (province) was monitored, but not considered for the quotas. For waves 2 and 3, all respondents were incentivized to participate again.

iii) Meinungsraum Online Access Panel: In order to increase the amount of first voters as much as possible, respondents for wave 1 were recruited based on the "best effort" method – no specific quotas were set. These respondents were recontacted only in wave 3, but not wave 2.

In order to increase the number of first-time voters in wave 1 in the general sample (not including the additional respondents recruited via the Meinungsraum Online Access Panel), the following measures were undertaken:

i) Extension of the field period
ii) A third reminder letter
iii) An incentives increase to 10 Euros

The following measures were undertaken in order to increase the number of first-time voters in wave 3 in the general sample (not including the additional respondents recruited via the Meinungsraum Online Access Panel):

i) A third reminder letter in the online sample
ii) An incentives increase to 10 Euros
iii) As far as data was available: invitation of respondents from the telephone survey via e-mail and vice versa
iv) As far as data was available: contacting respondents from the telephone survey via SMS with a short text that IFES will call again and that an incentive exists to participate as well as informing the respondents about the possibility to participate online. This measure did not lead to any new interviews.

In Table 1 we present a comparison between the target population and two different waves according to core demographic characteristics.

Table 1. Comparison of key characteristics in the sample and population (respondents in wave 1 & wave 3)

Variable	Unweighted		Weighted (Demographic + Design Weight)		Population
	Wave 1 (N=3846)	Wave 3 (N=1972)	Wave 1 (N=3846)	Wave 3 (N=1972)	
Gender					
Male	47,4	49,2	48,9	50,3	48,9
Female	52,6	50,8	51,1	49,7	51,1
Age					
16-45 years	43,9	47,4	41,6	46,2	41,6
Older than 45 years	56,1	52,6	58,4	53,8	58,4
Region					
Burgenland	3,6	3,4	3,7	3,3	3,7
Carinthia	5,9	6,1	6,9	6,5	6,9
Lower Austria	20,2	20,1	20,1	20,9	20,2
Upper Austria	17,4	17,8	17,2	17,4	17,3
Salzburg	6,0	5,7	6,2	6,2	6,1
Styria	16,0	16,3	15,2	14,6	15,2
Tyrol	7,5	6,5	8,5	7,6	8,5

4.2 Field Work

The fieldwork was conducted by the Institute for Empirical Social Studies (IFES) within the following periods (see **Table 2**).

Table 2. Fieldwork and interview length

Wave #	Mode	Fieldwork period	Comment
Wave 1	CATI	1 June 2017 – 4 August 2017	Additional first voters: 27 June 2017 – 9 July
Wave 1	CAWI	12 June 2017 – 30 July 2017	6 cases interviewed in August 2017
Wave 2	CATI	1 September 2017 – 13 October 2017	Not available via telephone, but online: 12
Wave 2	CAWI	11 September 2017 – 14 October 2017	October 2017 – 15 October 2017
Wave 3	CATI	18 October 2017 – 15 December 2017	Additional first voters: 19 October 2017 – 11
Wave 3	CAWI	19 October 2017 – 12 December 2017	November 2017

4.3 Panel participation

Respondents were asked and incentivized with €5 to participate in each wave of the panel. All respondents from Wave 1 were invited to participate in the subsequent waves, apart from the oversample of first-time voters from the Meinungsraum Online Access Panel who were not recontacted in Wave 2 but only in Wave 3.

The initial, total sample size consists of 3,951 respondents that took at least Wave 1. We subsequently removed 105 respondents that did not give consent to release their data even in anonymous form. In addition, 62 cases have been split into two groups of respondents (62 respondents that took only Wave 1 and 62 respondents that took only Wave 2 and Wave 3), due to unmatching demographic data between Wave 1 and Wave 2 (see section 5 on data cleaning). For this reason, **the final N consists of 3908 respondents**, **of which 1291 participated in all three waves.**

Table 3 shows the sample sizes and response rates per wave. In the dataset, the variables panelpat and w*_panelist inform about the individual pattern of panel participation and participation in each wave after data cleaning.

Table 3. Sample sizes and response rates

	Wave 1	Wave 2	Wave 3
Gross samples sizes (incl. cases excluded ex-post)			
N respondents (total)	**3951**	**1869**	**1998**
- of which took Wave 1 only		1869	619
- of which took Wave 2 only			0
- of which took both Wave 1 and Wave 2			1379
Response rate compared to Wave 1		*47.3%*	*50.6%*
Final sample sizes (after data cleaning ex-post)			
N respondents (total)	**3846**	**1795**	**1972**
- of which took Wave 1 only		1733	619
- of which took Wave 2 only			62
- of which took both Wave 1 and Wave 2			1291

5. Data Cleaning

5.1 Data Protection

We removed from the dataset the responses of 105 respondents who did not give their consent to release the data even in anonymous form. In addition, data on the month of birth ("w1_sd2") was removed to anonymize the dataset.

All information on postal codes (questions "w1_sd18" "w2_sd4" and "w3_sd3") as well as the regional constituency (Regionalwahlkreis, variable "regwk") had to be removed for reasons of data protection. However, postal codes were used to identify an additional variable:

- We merge the categorized population number (EINWOHNERZAHL (KATEGORISIERT)): **popnum**

5.2 Quality assurance and excluded respondents

We excluded some cases due to quality issues.

1.) We excluded all the reponses from 52 respondents in Wave 2 due to unmatching demographic data across waves. These respondents provided both a different year of birth and a different gender in Wave 2 compared to Wave 1, and subsequently either they did not take Wave 3 or in Wave 3 they confirmed both the year of birth and gender provided in Wave 1.

2.) We split 62 respondents due to unmatching demographic data across waves. These respondents provided both a different year of birth and a different gender in Wave 2 compared to Wave 1, and subsequently in Wave 3 confirmed both the year of birth and gender provided in Wave 2. We decided therefore to treat the respondents in Wave 1 as unique respondents that took only Wave 1, and treat the respondents in Wave 2 and Wave 3 as new respondents. For this reason, the final sample includes 62 additional respondents that participated in Wave 2 and Wave 3, but not in wave 1.

5.3 Recoding demographic information for anonymity reasons

We recoded demographic information from the variables education, religion, and country of birth, in order to avoid possible identification of respondents

- **Education** (w1_sd6). We collapsed the original category 2 ("no school completed") with category 3 ("elementary school or less"). We also recoded those who went to a "special school" (category 5, "Sonderschule") as equal to category 16 ("other education")
- **Religious affiliation** (w1_sd15). We recoded the religious affiliation into a new variable (w1_sd15r) collapsing category 4 ("Islamic Alevi religious community") with category 3 ("Islamic religious community") and the category 6 ("Jewish religious community") with category 7 ("other").
- **Country of birth** (w1_sd5). We recoded the countries of birth into a new variable (w1_sd5r) with five categories: (1) Austria, (2) Germany, (3) Croatia, Serbia, Bosnia, and Former Yugoslavia, (4) Hungary, Slovakia, Slovenia, Czech Republic, and Poland, and (5) other countries (including, among the others, also Turkey and Russia).
- **Household size** (w1_sd21): We recoded household size into a new variable (w1_sd21r) collapsing households with 6, 7, or 8 household members into one category of "6 or more" members.

5.4 Variable format and missing values

All standard socio-demographic variables (both for panel and fresh respondents) are designated by: **sd***

All other questions have the following standard format:

Table 4. Format of variable names

	Wave #	question #	item #	text/string
abbreviation	w*	_q*	x*	t
example	2	24	5	
		= **w2_q24x5**		

If applicable, missing values were coded as follows:

77 = do not know party/person

88 = don't know

99 = refused

6. Weighting of data

The dataset includes several weighting variables which can be used for design and post-stratification adjustments to known population distributions. For the respondents of each wave (1, 2, 3) as well as for respondents participating in all three waves (123) two weighting variables are provided:

- Design weight (IFES): **w*_weight_design_ifes**
  The "design weight" adjusts for the unequal selection probabilities in the telephone sample as well as for the oversampling of young voters.
- Demographic weight: **w*_weightd**
  The "demographic weight" adjusts to known socio-demographic population distributions (see Table 1) only, not taking into account unequal sampling probabilities that are caused by the sampling design.
- Demographic + design weight: **w*_weightdd**
  The "demographic+design" weight adjusts to socio-demographic population distribution (see Table 1) and uses the design weight as a starting weight (w*_weight_design_ifes).
- Demographic + design weight (IFES): **w*_weightdd_ifes**
  The "demographic+design (IFES)" weight adjusts to socio-demographic target distributions similar to those used in the **AUTNES Pre- and Post Panel Study 2013** (ZA5859). As in the previous study, this weight also uses the design weight as a starting weight (w*_weight_design_ifes). The weight has been calculated, in particular, to allow for comparisons across elections.

The socio-demographic target distributions used to calculate the demographic weight (**w*_weightd)** and the demographic + design weight (**w*_weightdd**) are shown in Table 1. In addition, the election results are shown for purposes of comparison. The socio-demographic target distributions are based on Micro Census data 2016 (Statistics Austria StatCube, retrieved July 2017) using the Austrian population aged ≥ 15 having Austrian citizenship as the reference population, i.e., a total of approx. 6,316,000 residents. Official election results are provided by the Austrian Ministry of the Interior (http://wahl13.bmi.gv.at and https://wahl17.bmi.gv.at).

The survey-based marginals for turnout and vote choice in Table 1 were calculated using recall-questions on voting behavior in the previous 2013 national election (i.e., variables **w1_q9** for wave 1) or the 2017 national election (i.e., variables **w3_q15** and **w3_q16** for waves 3), respectively. The measures are reported only for purposes of comparison and were not used for the construction of weights.

For computing the weighting variables, we used the STATA module "ipfweight". Computation of all weighting variables was limited to a minimum value of 0.20 and a maximum value of 5.00. Missing values in the target variables were weighted neutrally.

7. Coding of Open-Ended Questions

7.1 Most important issues

All questions on issues (most important problem) used a code scheme that was developed for AUTNES and that is also used by the AUTNES Supply Side and the AUTNES Media Side. The code scheme consists of three hierarchical levels (level 1: 17 categories, level 2: 94 categories, level 3: 790 categories).

One coder did all coding. A codebook listing detailed coding rules was provided. Level 3 of the AUTNES code scheme consists of the 790 categories, which are pooled to 94 categories at level 2 and to 17 categories at level 1. The coder tried to match the responses with one of the listed categories. Two additional categories were added: (1) Answers which lacked detailed information were coded as “99999 | not classifiable”; (2) respondents mentioning that no problems prevail in Austria were coded as “77777 | no problem in Austria”. A few respondents gave more than one answer. In this case, only the first problem was coded. However, when this was not possible because the description was too ambiguous, the succeeding issue was coded instead.

The following list includes all the categories on level 1 (the most general category). A comprehensive table that includes all categories on level 1, 2 and 3 can be found in the appendix.

10000 "economy"

11000 "welfare state"

12000 "budget"

13000 "education and culture"

14000 "security"

15000 "army"

16000 "foreign policy"

17000 "Europe"

18000 "infrastructure"

19000 "society"

20000 "environment protection"

21000 "reform of institutions"

22000 "immigration"

23000 "formation of government"

24000 "ideology"

25000 "politics"

26000 "politicians in news coverage"

77777 "no problem in Austria"

99999 " not classifiable"

7.2 ISCO codes

ISCO codes in the variables “w1_sd11_isco” and “w1_sd13_isco” were assigned based on the open-ended questions “w1_sd11” and “w1_sd13”. 974 ISCO codes were automatically assigned by a text coding algorithm, the remaining 2241 responses were coded manually by two coders. The coding scheme used was the Ö-ISCO 08 and a codebook listing detailed coding rules was provided.

7.3 Coding experiment

After being asked the questions on satisfaction with the performance of the incumbent government (w1_q7), respondents have been split in two groups and asked two follow-up open-ended questions each. The two questions answered by the first group are denoted in the table below as w1_q_SplitA_1t and w1_q_SplitA_2t respectively. The two questions answered by the second group are denoted in the table below as w1_q_SplitB_1t and w1_q_SplitB_2t respectively.

The open-ended questions have then be coded using the coding scheme for Issues and Actors (separately Actor Name and/or Actor Organization) plus predicates developed by AUTNES. The coding of all questions on retrospective evaluation is based on the Level 1 coding scheme that was developed for AUTNES and that is also used by the AUTNES Supply side and the AUTNES Media Side. Note that while the original coding scheme includes three hierarchical levels, for these set of questions Level 1 only is used. The coding results in a series of additional variables listed in the column "***VARIABLES ADDED AFTER CODING***" in the table below. A few respondents gave more than one answer. In this case, only the first issue/actor was coded. However, when this was not possible because the description was too ambiguous, the succeeding issue was coded instead.

Two coders did all coding. The coders tried to match the responses with one of the listed categories. In case of discordance between the two coders, a third coder was involved to settle the remaining issues. The following rules applied to the coding for the single variables:

Category **Issue or Actors**
Coding: 0 no issue/no actor mentioned, only general statement / 1 one/more issues mentioned / 2 one/more actors mentioned / 3 multiple issues or actors mentioned

- **Rule 1:** If policies are <u>not mentioned</u> <u>explicitly</u> and the actor is only <u>implicitly</u> mentioned – then it is coded as 1 – the policy includes the issue "politics" or "reform of institutions" (*e.g. die dauernden Streitigkeiten or "Streit"*)
- **Rule 2:** If policies <u>are mentioned explicitly</u> but and the actor is only <u>implicitly</u> <u>mentioned</u> than it should be coded 1
- **Rule 3:** if policies are <u>mentioned</u> <u>explicitly (e.g.</u> reform of institutions<u>, etc.)</u> and as actor the government is <u>mentioned</u> <u>explicitly</u> (= government or coalition) than it should be coded as 3 (= multiple issues or actors mentioned) as "Regierung" (government) is regarded as an actor
- **Rule 4:** General terms such as "Parteien" (parties), "Politiker" (politicians), "Koalition" (coalition), "Koalitionspartner" (coalition partner) and "Regierung" (government) are considered to be actors
- **Rule 5:** Very general sentences like "Neuwahlen, die nicht notwendig sein sollten" should be coded as 0

<u>Note:</u> The topic 21000 "reform of institutions" entails in 95% of the codings statements referring to the conflict / fights between the coalition partners ("Streit, Streitigkeiten, Blockade, etc."). Thus, this topic could be best linked with the level 3 coding 21112 "performance / efficiency in politics" that has been used in the AUTNES coding schemes for the supply and the media side.

Category **Issue**

- **Rule 1:** If no topic was assigned under the category "Issue or Actors", no topic can be assigned in this category
- **Rule 2:** The topics "Politikergehälter" (politicians' salary) and "Bürokratie" (bureaucracy) fall into the category "reform of institutions"
- **Rule 3:** The topic "Chancengleicheit" (equality of opportunity) points towards gender issues and thus hence fall into the category "society"
- **Rule 4:** The topic "Korruption" (corruption) falls into the category "budget"

Category **Assessment**
Coding: 0 = neutral/no tendency /1 = negative/2 =positive

- Rule 1: The different response options are merged into three responses: positive – neutral/no tendency – negative

Categories **NAME** and **ORGANISATION**

- **Rule 1:** Even if no actor has been coded under the category "Issue or Actors", coding is still possible as the terms "Regierung" (government), "Koalitionspartner" (coalition partner), "Koalitionsparteien" (coalition parties) etc., fall into this category (under category "Issue or Actors" it was coded as 1)
- **Rule 2:** If the government has been mentioned only implicitly than **no** organization will be coded
- **Rule 3:** If the term "Regierungsparteien" (government parties) has been mentioned than the correct coding is "government". Not the single parties in the coalition should then be mentioned.
- **Rule 4:** A new category "parties" is created for the terms "Parteien", "Großparteien", "Politiker" etc.

The following table lists all variables in the questionnaire as well as the variables added after the coding.

VARIABLES IN THE QUESTIONNAIRE			***VARIABLES ADDED AFTER CODING***	***CODING***	
WHAT WAS R. THINKING OF WHEN ASSESSING THE FEDERAL GOVERNMENT	w1_q_SplitA_1t	string			
			w1_q_SplitA_1_ia	0	no issue/no actor mentioned, only general statement
				1	one/more issues mentioned
				2	one/more actors mentioned
				3	multiple issues or actors mentioned
			w1_q_SplitA_1_i1	10000	economy
				11000	welfare state
				12000	budget
				13000	education and culture
				14000	security
				15000	army
				16000	foreign policy
				17000	Europe
				18000	infrastructure
				19000	society
				20000	environment protection
				21000	reform of institutions
				22000	immigration
				23000	formation of government
				24000	ideology
				25000	politics
				26000	politicians in news coverage
				99999	no issue
			w1_q_SplitA_1_i1_pr	0	neutral/no tendency
				1	negative
