1. Context and objectives of the research

The current piece of research is an integral part of the Horizon2020 REMINDER project. Its core objective is to bring a multidisciplinary approach to understanding free movement in Europe. A consortium of 14 organisations, the project combines expertise from different fields including: development, economics, linguistics, media studies, political science and public policy.

More specifically, this experimental survey is included in one of the two main components of the REMINDER project, related to political and media narratives about intra-EU mobility. The project examines how different media portray intra-EU mobility and what factors drive individuals' views on free movement, including narratives used in party political communications and traditional and social media. It also examines why media narratives on intra-EU mobility differ across Member States.

Work package 9 is led by the Johannes Gutenberg Universität in Mainz, in collaboration with the universities of Gothenburg and Vienna. In this experimental survey, we tested for the influence of specific media content on attitudes and opinions. We conducted survey experiments in all seven countries covered by the main multi-wave panel survey (the UK, Germany, Spain, Sweden, Hungary, Romania and Poland) to test whether specific narratives, story-telling elements and depictions shape perceptions about EU migrants and their impact on welfare.

2. The experimental survey

a. Universe, response targets and collection mode

The universe of the survey consisted in the general population aged 18 years and older, currently residing in each of the 7 countries covered by this survey (see list below). More specifically, it corresponds to the electoral population, considering that the voting age is 18yo in all these seven countries.
The target number of completed interviews was approximately 1200 respondents per country.

	Target sample size	Achieved number of interviews
Germany	1200	1210
Hungary	1200	1203
Poland	1200	1220
Romania	1200	1207
Spain	1200	1214
Sweden	1200	1202
UK	1200	1201
TOTAL	**8400**	**8457**

The data was collected through an online survey. In particular, in order to achieve the above-mentioned objectives with the highest quality and within a limited time, OPINION & IMPACT collaborated with one of its main partners Dynata. Dynata, formerly known as ResearchNow SSI, is a leader in online sampling and digital data capture. Dynata is represented in more than 40 countries on every continent and has more than 11 million panelists worldwide.

b. Quality of the sampling frame

The sample was stratified according to the most up-to-date census data. In each country, quota definitions were based on gender and age, in order to ensure that survey represents the most accurate estimations of the target populations[1].

Based on research, we systematically send respondents generic survey invitations with

[1] Quotas were set as independent response targets for each characteristic: targets were pursued per class within each variable, regardless of achievement for the other quota variables.

limited information about the survey: our survey invitation emails[2] notify the respondent of an opportunity to share his/her opinions.

Online panels depend on non-probabilistic sampling procedures, in which potential respondents voluntarily sign up to participate in the panel in general and in the survey in particular, which might induce a certain self-selection bias. In order to limit such bias, a solid sampling frame and an effective sampling procedure were set up. For the former, we made sure of the ability of the panel partner to reach a sample quantitatively sufficient and qualitatively satisfactory.

The way in which a supplier gets its sample directly affects two important aspects, which in turn affect the overall quality:

1. Bias.

Distortion in a sample leads to results that are not representative. In survey research, high distortion equates to results that are consistent but not representative. Bias is a potentially serious issue in online surveys. Online research is a form of sampling non-probabilities because some populations have no chance of being selected - in this case, people who are not online. For this reason, procurement providers must set strict standards to ensure that the sampling frame is precisely representative, has a large population reach, and recruits data sources from multiple channels. Our partner relies on his strong know-how in the following dimensions:

- Open recruitment through digital mass advertising that draws samples from the entire Internet and increases representativeness at national and global levels.
- Affiliate networks that partner with web-based companies to build traffic and reach innovators, early adopters, and hard-to-reach segments.
- Mobile apps, a valuable source for younger users of samples and data - and increasingly important for representativeness, as mobile Internet use goes beyond desktop access.

2. Variance.

Variance is a measure of representativeness over time or consistency. In research, samples with high variance provide results that change unpredictably, which is particularly problematic for tracker studies.

- In order to control the variance, our partner regularly ensures a high consistency in his sample and in the research experience. In order to achieve the first, stable, consistent recruitment efforts must be built to prevent short-term recruitment imbalances and maintain long-term relationships by treating the sample with respect, consideration and transparency to promote longevity.

[2] The invitation instructs the respondent to log-on to the panel portal to access the survey. Our emails are CAN-SPAM compliant. Each invitation includes a link to our privacy policy, a removal link, a link to contact us, and a link to find a lost password.

- To deliver a consistent, high-quality research experience, our panel partner ensures that the survey designs are easy to navigate and fit for their purpose. and that their technology and connectivity are robust to ensure reliable sample availability.

c. Questionnaire and experiment design

The team from the University of Mainz and Gothenburg were in charge of drafting the questionnaire and of providing OPINION & IMPACT with the English version of the questionnaire, as well as the experiment stimuli.

Indeed, the experimental survey included a stimulus shown to each respondent in the core of the questionnaire. The number and nature of the stimuli depended on the country. In total, 9 variations of the stimuli were designed: four related to immigration, four related to emigration and one control design, which had no relation with the topic.
In each country, n50 respondents received the control stimulus.
In **Hungary, Poland, Romania and Spain**, each of the n1150 remaining respondents received EITHER:

a) One (1) stimulus related to IMMIGRATION: 1 of the 4 combinations (National level+Positive // National level+Negative // Personal level+Positive OR Personal level+Negative)

<u>OR</u>

b) One (1) stimulus related to EMIGRATION: 1 of the 4 combinations (National level+Positive // National level+Negative // Personal level+Positive OR Personal level+Negative)

In the ***UK, Sweden and Germany***, each of the n1150 remaining respondents received 1 stimulus related to IMMIGRATION: 1 of the 4 combinations (National level+Positive // National level+Negative // Personal level+Positive OR Personal level+Negative).

The table below summarizes the experimental design.

	IMMIGRATION				EMIGRATION				CONTROL	TOTAL
	NATIONAL LEVEL		PERSONAL LEVEL		NATIONAL LEVEL		PERSONAL LEVEL			
	Immigration NEGATIVE	Immigration POSITIVE	Immigration NEGATIVE	Immigration POSITIVE	Emigration NEGATIVE	Emigration POSITIVE	Emigration NEGATIVE	Emigration POSITIVE		
Germany	288	287	287	288					50	1200
Hungary	144	144	144	144	144	144	143	143	50	1200
Poland	144	144	144	144	144	144	143	143	50	1200
Romania	144	144	144	144	144	144	143	143	50	1200
Spain	144	144	144	144	144	144	143	143	50	1200
Sweden	288	287	287	288					50	1200
UK	288	287	287	288					50	1200
TOTAL	**1440**	**1437**	**1437**	**1440**	**576**	**576**	**572**	**572**	**350**	**8400**

The complete set of stimuli was also translated from English into the other six languages. The texts were converted into image files by the University of Vienna and provided as jpg files for the implementation in the survey.

d. Translation process

A full translation process: In multi-country projects, accuracy and consistency of research material throughout all covered countries is paramount, in order to ensure optimal comparability of survey results across countries/language.

The questionnaire was translated and scripted in the 7 following languages: German, Swedish, English, Spanish, Polish, Hungarian and Romanian.

The translation process covered the four following steps:

1) Analysis / revision of the source version:

The original source questionnaire was thoroughly analyzed / revised by English-speaking linguists. The goal was to improve the source version to facilitate later translation. Specifically, this upstream analysis of the source version contributed to:

- Correct all errors in the source version
- Identify possible ambiguities in the source version that can lead to misunderstandings / incorrect translations.
- Identify cultural specificities that may not be present in the target market (or confuse respondents).
- Increase intercultural equivalence between the source questionnaire and subsequent translations. This process was carried out in collaboration with the questionnaire developer.

2) Translation

The questionnaire was translated by professional linguists who are: ➢ specialists in the translation of survey material ➢ native speakers ➢ living in the country in which the survey takes place, thus having a perfect knowledge of the cultural background of the country. Any necessary adaptations/cultural particularities was integrated at this stage.

3) Revision 1

The translation was then revised by a third linguist specialized in the translation of survey materials. S/he made sure that all instructions had been followed. S/he corrected any linguistic issues (style, tone, structure of phrases, etc.), while maintaining cross- cultural equivalence between the source questionnaire and the translation. Potential adaptations/cultural particularities were checked at this stage.

4) Revision 2

Reviser 2 finally corrected any remaining minor linguistic issues (spelling mistakes, grammar issues, etc.).

The translation agency who managed the process has more than eleven years of experience in translation coordination for large-scale international studies, thus guaranteeing that the translation process followed the highest quality standards.

- Coordination of linguistic quality control for large-scale international studies:
  - ✓ OECD/PISA and OECD/PIAAC
  - ✓ IEA/PIRLS, IEA/TIMSS and IEA/ICILS
  - ✓ UNESCO/LAMP
  - ✓ ESS (European Social Survey)

- Translation project coordination for the following studies:
  - ✓ Eurobarometer/European Commission
  - ✓ Connected Consumer Survey (Google)
  - ✓ Global Attitudes (PEW Research Centre)

e. Scripting

The survey used centralized scripting. More specifically:

- We built a centralised master script from the validated questionnaire, including the filters, respondent instructions and the visual layout of the survey (online script).
- Once the translation process was completed and local versions of the questionnaire were approved, these versions were overlaid on the master script, thus ensuring that each question, answer choice, instruction messages and filters were consistent across all languages;
- Each of the local scripts were then thoroughly checked: a first systematic control was carried out to make sure that all questions and answers were present, and that all filters were correctly applied in all languages. Additionally, a manual validation was implemented by native speakers of each language, to make sure that the layout of the survey was optimal.

f. Fieldwork

1. Pretest

Prior to launching the fieldwork of the experimental survey, we ran a preliminary phase of pretesting of the questionnaire, in order to ensure that it fit with the survey's objectives, throughout all countries.

More specifically, the following steps that were carried out during this pre-testing phase:

- ✓ Once all the national versions of the questionnaire have been finalised and scripted, we ran a first validation by executing a "dummy data test". This procedure consists in "pushing" dummy respondents throughout the survey,

in order to test the structure and the routing. More specifically, we produced an SPSS data file of about 200 respondents in each of the 7 countries. We were thus able to make sure that all filters were correctly implemented, that the allocation of respondents in the different cells of the experiment (with the proper stimulus) was done according to plan, and that all questions were answered by the appropriate respondents.

Dummy data test

Country	DE	ES	HU	PL	RO	SE	UK	TOTAL
Nb of respondents	200	200	200	200	200	200	200	1400

- ✓ Once this validation phase was done, we ran a proper pre-test of the survey by soft launching it to "real" respondents. Instead of inviting the total number of respondents to answer the survey, we sent out a moderate number of invitations, in order to receive approximately 50 completed interviews by country. We then produced a data file, which was thoroughly analysed, to make sure that there were no substantial issues when the questionnaire was presented to respondents. More specifically, we looked at the proportion of respondents who answered "Don't know / No answer": indeed, high DK rate on a specific question could imply that this question is not clearly formulated and thus not clearly understood by respondents. Additionally, we distinguished between the different languages, to identify possible language-related issues.

Soft launch

Country	DE	ES	HU	PL	RO	SE	UK	TOTAL
Nb of respondents	55	61	53	52	58	55	52	386

- ✓ Thanks to this thorough analysis, we were able to run extra validations, specifically on the stimuli files presented to respondents.
- ✓ Finally, we were able to fully launch the survey with a very high level of confidence.

The table below details the dates in which fieldwork was opened and closed in each country, as well as the number of completed interviews per country.

	Final sample size	Fieldwork dates
Germany	1210	5 – 20 Sept, 2019.
Hungary	1203	5 – 24 Sept, 2019.
Poland	1220	5 – 24 Sept, 2019.
Romania	1207	5 – 23 Sept, 2019.
Spain	1214	5 – 23 Sept, 2019.

Sweden	1202	5 – 24 Sept, 2019.
UK	1201	5 – 23 Sept, 2019.

g. Weighting

The sampling design and specific fieldwork strategies were designed to maximise the representativeness of the sample. In addition, the weighting strategy was designed to correct any misbalance following fieldwork.
In terms of **weighting variables**, weight was calculated based on the two original quota targets (age and gender).
For the construction of the weight variables, a **rim weighting procedure** was run against the population figures. The procedure was executed separately for each country. Rim weighting consists of iterations; sample counts for each weight variable class are adjusted to fit the actual population proportions (marginal percentages), using as the initial values the result of the previous adjustment.

h. Data processing

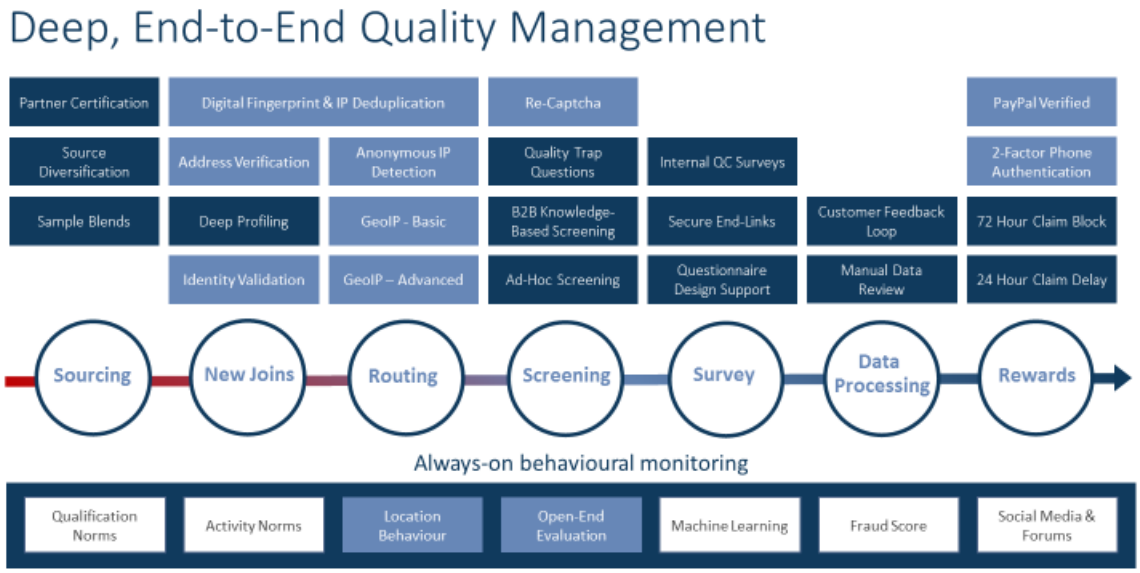
In line with the centralized scripting and web hosting of the survey, we implemented a centralised data processing, in order to ensure consistent and robust results.

- ✓ After the initial soft launch phase and subsequently at the end of the fieldwork period, the data was thoroughly and systematically checked. A number of quality controls have been implemented, in order to optimise the quality of the data (see below).
- ✓ Once we were satisfied with the quality of the data, it was weighted, in order to ensure perfect representativeness of the sample with the target universe (see previous section for more details).
- ✓ Finally, the data was aggregated into a single data file. In addition, cross tabulation tables were also prepared.

- **Quality management at every stage of the project**

Our panel partner has developed a set of tools to confirm that the right person answered the survey and that it was completely focused on completing the questionnaire. These measures are the key to ensuring absolutely reliable data throughout the project.

In every single process step, we have set up a set of quality management measures to ensure that the data collected is of the highest quality.



- **Main survey quality control measures**

In order to maximise the quality of the results from the main experimental survey, a series of targeted quality control measures have been applied.
Some measures are integrated in the script itself and lead to the automatic exclusion of the respondent. Others will be implemented during the data validation phase: respondents may be excluded a posteriori, if they failed either an individual measure or a combination of QC measures.

More specifically:

A. Quality control measures integrated within the script:

A1: List of emotions towards immigrants (Q19)
>> This question lists a combination of positive and negative emotions and asks respondents to indicate to what extent they feel each of the emotions when thinking about immigrants.
>> To detect speedsters and dishonest respondents, the following QC measure was taken: if a respondent "straightlines" this grid, i.e. selects the same answer for each emotion, he/she will be automatically excluded from the survey.

B. Quality control measures implemented during the data validation phase:

B1: Speedsters
>> In line with the industry standard practice, all respondents who completed the survey in less than 30% of the median completion time will be excluded from the list of completes

B2: Age and gender
>> To detect dishonest or unfocused respondents, we deliberately repeated the age and gender questions at the end of the survey. Since these questions are factual, the answers should be consistent for any given respondent. As a result, any discrepancy between the answers given at the beginning and at the end of the survey on these two questions will be considered as a failed QC measure and will be taken into account to evaluate the respondent's quality.

B3: Straightliners
>> we will check whether respondents complete the grid questions in a systematic way. We will look at all grid questions globally and not question per question, as it is possible for some people to answer "totally agree" to all statements of Q6, Q9, Q16, etc.
>> However, as mentioned in A1, straighlining Q19 will result in exclusion.

B4: Verify
>> Internal system to avoid any duplication on the same study. In fact, a respondent is identified by a whole set of criteria, including a specific identification, the machine ID, and so on. The panel company's system detects that a panellist is taking part in a survey and won't allow a person to participate in the same survey twice.

B5: Trust score
>> The panel company has a dedicated team that follows the panellists over time. They observe all the answers given by them to the various surveys they have completed and make sure of their quality. Once a suspicious response has been given, the respondent is "flagged" and a certain number of points are assigned to him/her. Once the maximum point threshold has been reached for what they consider

to be a "reliable" panellist, the respondent is then identified by the Fraud team and is therefore no longer solicited to take part in surveys.

B6: Data Processing checks

>> At each key stage of the project (soft launch and final data), a dedicated team checks that the collected data match the programming notes included in the questionnaire (filters, cell allocation, rotations, etc.). The aim is to be able to guarantee the quality of the data by being able to spot any discrepancies.

i. Margin of error

Readers are reminded that survey results are estimations, the accuracy of which, everything being equal, rests upon the sample size and upon the observed percentage. Actual percentages thus vary within a certain confidence interval.
The table on the following page presents the margin of error associated to different sample sizes, at the 95% level of confidence. The last column on the right-hand size presents the maximum margin of error. For example, for a sample of 1,000 respondents, the maximum margin of error is +/- 3.1pp.

Statistical Margins due to the sampling process
(at the 95% level of confidence)

various sample sizes are in rows — *various observed results are in columns*

	5% 95%	10% 90%	15% 85%	20% 80%	25% 75%	30% 70%	35% 65%	40% 60%	45% 55%	50% 50%

N=14000	0,4	0,5	0,6	0,7	0,7	0,8	0,8	0,8	0,8	0,8
N=15000	0,3	0,5	0,6	0,6	0,7	0,7	0,8	0,8	0,8	0,8

In line with AAPOR reporting recommendations, we note that for the online survey, respondents for this survey were selected among those who registered to participate in online panel surveys and polls. Because the sample is based on those who initially self-selected for participation in the panel rather than a probability sample, no estimates of sampling error can be calculated.[3]

[3] See AAPOR, Education/Resources, For Researchers, 'Opt-in Surveys and Margin of Error', http://www.aapor.org/Education-Resources/For-Researchers/Poll-Survey-FAQ/Opt-In-Surveys-and-Margin-of-Error.aspx

APPENDIX 1 – Online interviews response rate

Response rates overview								
	COUNTRY							
	Germany	Hungary	Poland	Romania	Spain	Sweden	UK	TOTAL
Invitations sent	3 911	15 867	22 603	11 861	17 602	26 304	15 171	**113 319**

Full quota **	22	269	472	202	74	772	995	2 806
Incomplete ***	257	370	185	227	212	290	239	1 780
TOTAL COMPLETES	1 244	1 243	1 248	1 261	1 256	1 276	1 217	**8 745**
Cleaned out ****	34	40	28	54	42	74	16	288
COMPLETE and VALID	1 210	1 203	1 220	1 207	1 214	1 202	1 201	**8 457**

* Screening questions are country (1) and age (2), asked in that order.
Panelists declaring to reside in one of the 7 surveyed countries and to be 18 or older were screened in.

** Respondents were eligible and able but not selected because their cross-quota (gender*age*region) had enough cases.

*** Respondents were eligible, able and selected but they abandoned the interview before answering all questions.

**** Respondents were eligible, able, selected and completed the interview but they failed the quality control

INTRO – HEADER DO NOT SHOW

INFO NODE – SHOW ALL

You are receiving this invitation from social science researchers at the University of Mainz, University of Gothenburg and University of Vienna. We would like to understand political developments within the EU and therefore we would be interested in your political attitudes. Thank you for your valued contribution to this project.

The questionnaire will take you approximately 10 minutes to complete.
Please complete the entire questionnaire, including those questions that help us better identify your socio-demographic profile, as the success of the research depends on each questionnaire being fully completed. The information you provide is handled anonymously, and collected only for research purposes.

Thank you very much for your participation, which contributes to relevant and interesting research.

SOCIODEMO (for quota) – HEADER DO NOT SHOW
