Table 1

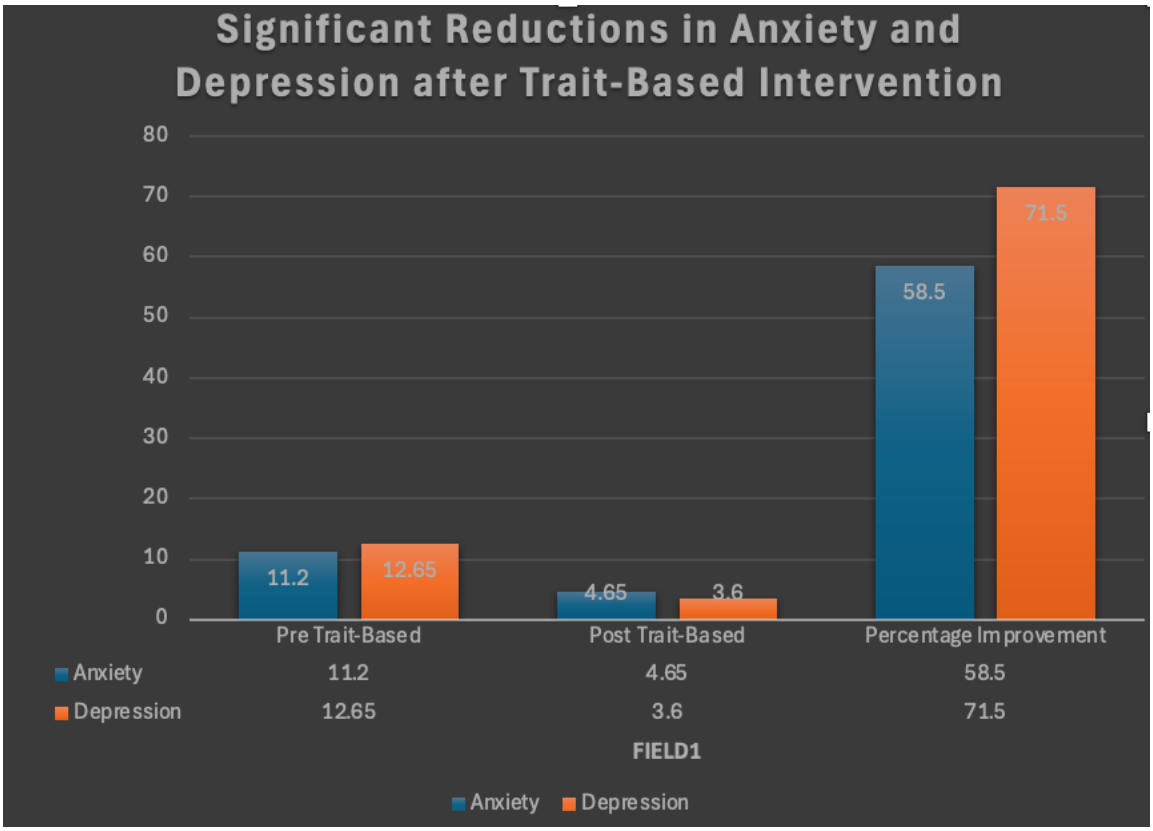
Improvements in Personality Traits Among Participants in the Trait-Based Model of Recovery

	Tenacity	Creativity	Determination	Authenticity	Motivational	Resilience	Self-Awareness	Appreciation	Emotional Intelligence	Empathy
Pre Trait-Based	63.91	64.54	67.81	68.52	66.07	71.82	77.87	71.01	62.3	65.32
Post Trait-Based	70.56	69.58	70.34	72.02	70.55	77.68	82.42	72.02	64.71	63.22
Percentage Improvement	10.41	7.81	3.73	4.7	6.78	8.16	5.84	1.42	3.87	-3.22

Note. This table summarizes the pre- and post-intervention scores for 10 personality traits, with Cronbach's alpha values indicating internal consistency for each scale. Statistically significant improvements were observed in nine of the ten traits, highlighting the program's effectiveness in fostering personal growth.

Table 2

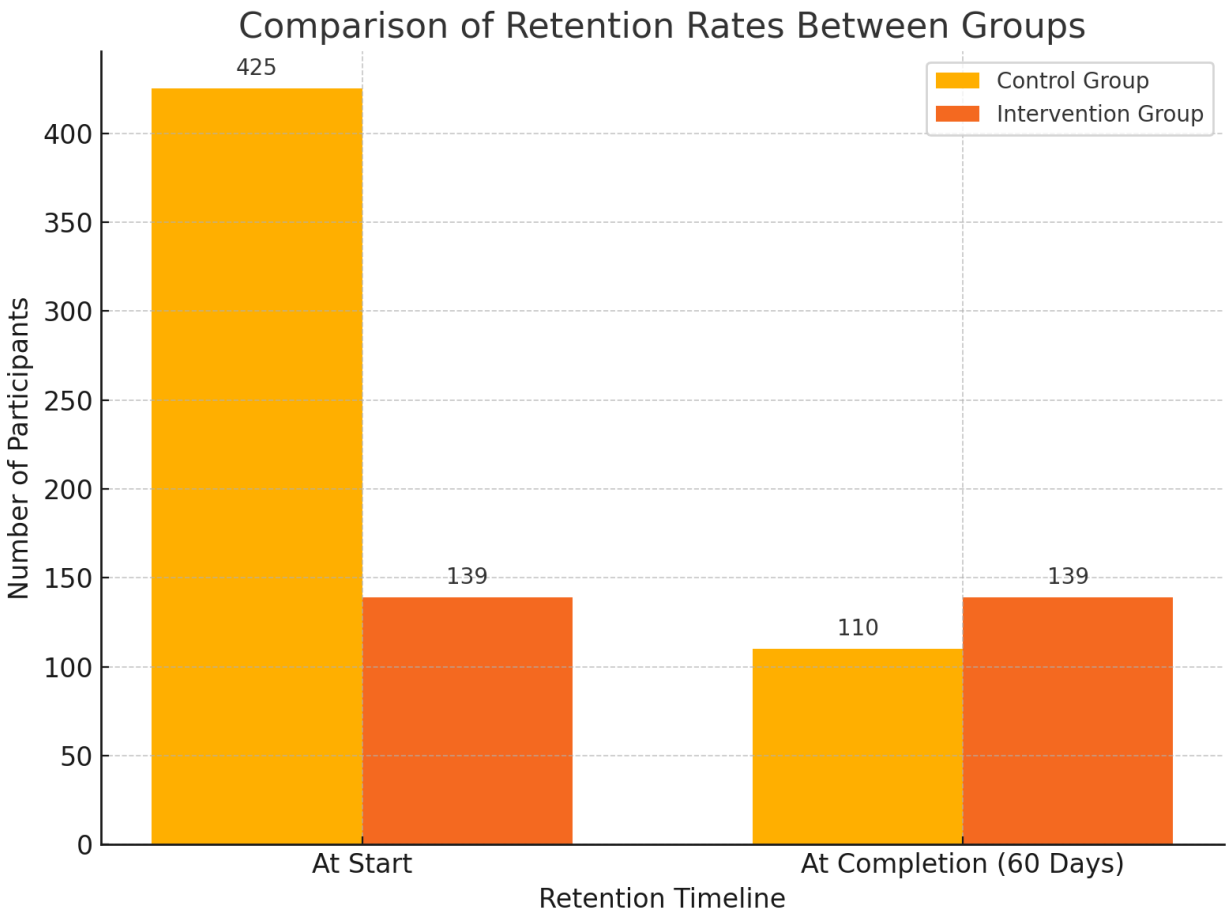
Pre- and Post-Intervention Anxiety and Depression Scores



Note. This table presents the mean scores for anxiety (GAD-7) and depression (PHQ-9) before and after the intervention. Both measures demonstrated significant reductions, with anxiety improving by 58.5% and depression by 71.5%, underscoring the Trait-Based Model's impact on mental health outcomes.

Table 3

Comparison of Retention Rates Between Intervention and Control Groups



Note. This table compares retention rates between the intervention group, which maintained 100% retention across 60 days, and the control group, which retained only 25.9% of participants over the same period. The data emphasizes the program's role in sustaining participant engagement and program completion.
