Plans for study-level metadata production at FSD

Anne Maunu and Katja Moilanen
Finnish Social Science Data Archive (FSD)

FSD is planning to enhance its study-level metadata production to ensure a smoother information flow. This improvement will be based on two revamped systems: the data depositing tool in the Aila data portal and the operational data management system TIIPII3.

Aila - data depositing tool

- May not be used for long-term preservation (GDPR)
- Data depositor provides most of the study-level metadata
- Finto AI or other APIs for vocabularies
- Metadata exported as a DDI 2.5 XML file in Finnish

DDI XML file

- Rarely used metadata fields may be added manually
- The DDI file in Finnish is saved to TIIPII3

Translation

- Finnish → English
- Automatic translations of vocabulary fields in TIIPII3
- Manual AI-assisted translation for a few fields
- The DDI file in English is saved to TIIPII3

TIIPII3 - operational database

- Storage for DDI XML files
- Primary place for storing and editing cumulative and changing metadata (e.g. publications, default texts)
- Automatic updates to the DDI files

Technical details

- Python3, Pyramid web framework for frontend, Tornado web framework for backend
- Jinja2 templating for generating DDI XML files
- lxml library for editing DDI files
- RESTful APIs
- AMQP messaging with RabbitMQ for automatic updates
