CURRENT SSJDA

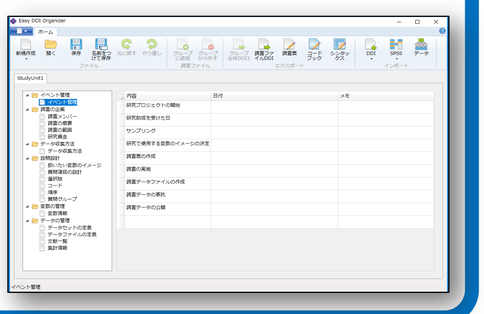
Nesstar* Project

[[2012 Nov.]]
▷ Test operations of Nesstar started (along with exisiting SPSS's WebApp). During test operations, we have experimentally adopted the user account system and searched for ways to efficiently register using Publisher. (e.g., Creating Japanese template and testing data conversion tools of different companies)
[[2014 Jan.]]
▷ Full-scale operation of Nesstar started. (SPSS WebApp has reached the end of its lifecycle.)
[[Today]]
▷ More than 100 data can be used, and English data (Japanese General Social Surveys) is also handled.

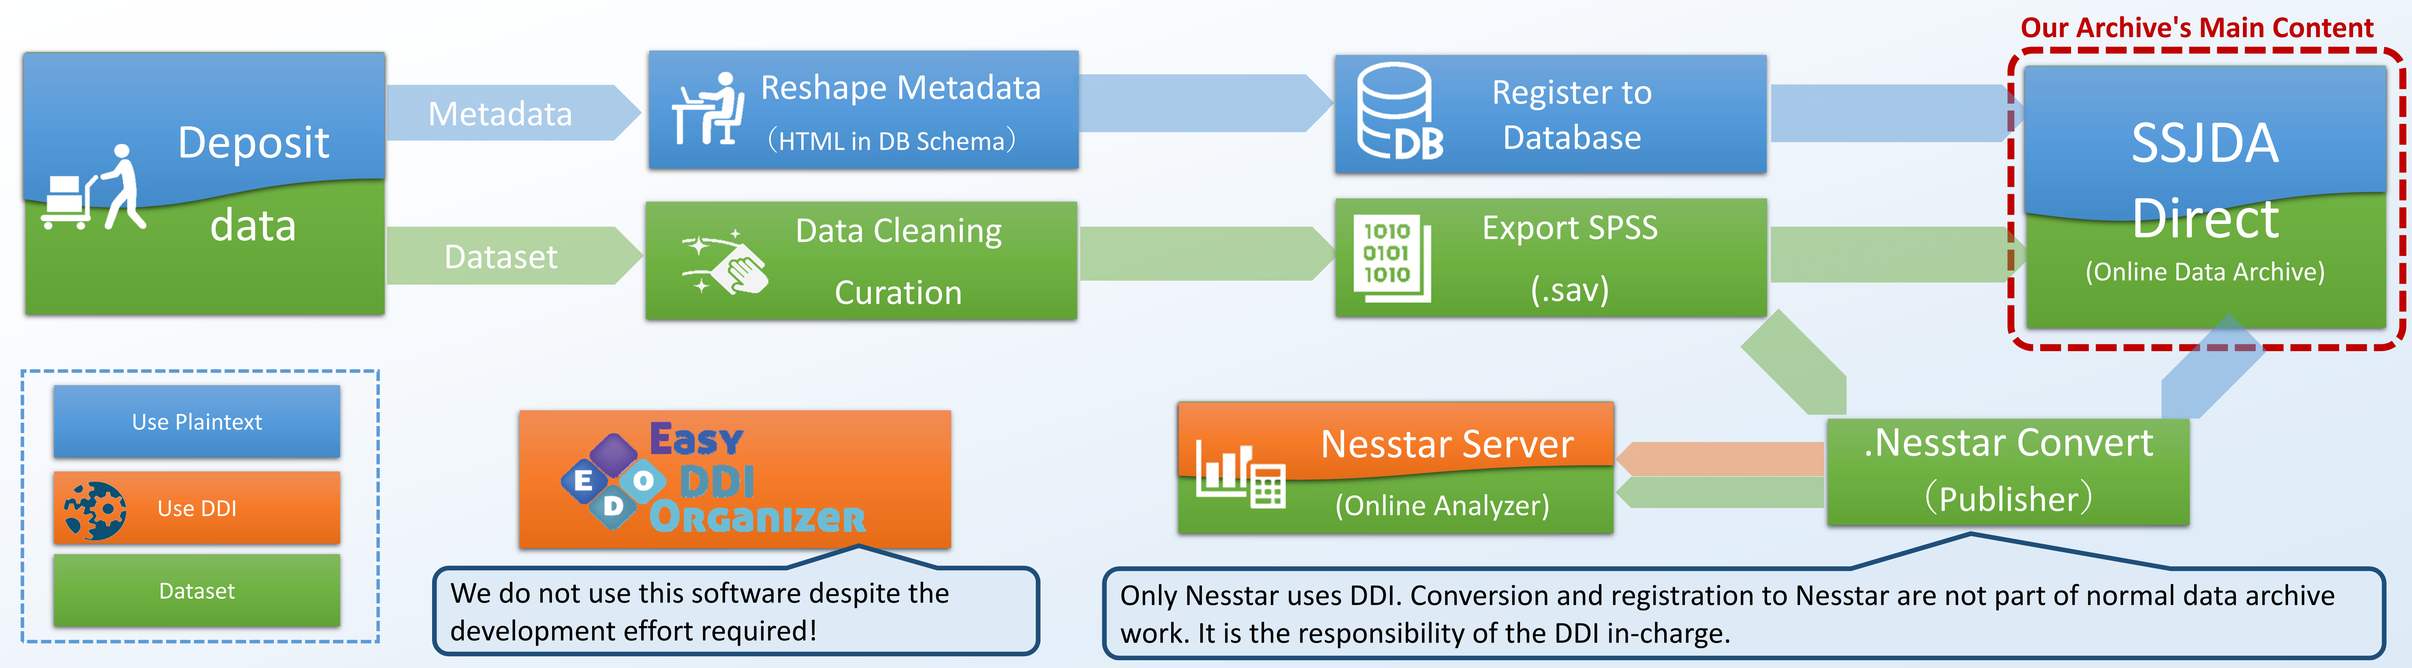
*Nesstar is owned by Norwegian Social Science Data Services (NSD).

Easy DDI Organizer (EDO) Project

[[2010 >>> Today]]
▷ Development of Easy DDI Organizer (EDO) metadata editor started. It can express DDI data lifecycle in Japanese and can create completely new DDI data, read SPSS, and export the codebook.
▷ EDO's program runs on .Net Framework 4 Series and WPF, and it was developed as an open-source software. The development of EDO continues as of 2018.
▷ Despite the development effort, EDO is still underused. The idea of the data lifecycle is very important, but tools made based on this idea are very hard to use. This is because only a little Japanese metadata considers the lifecycle.

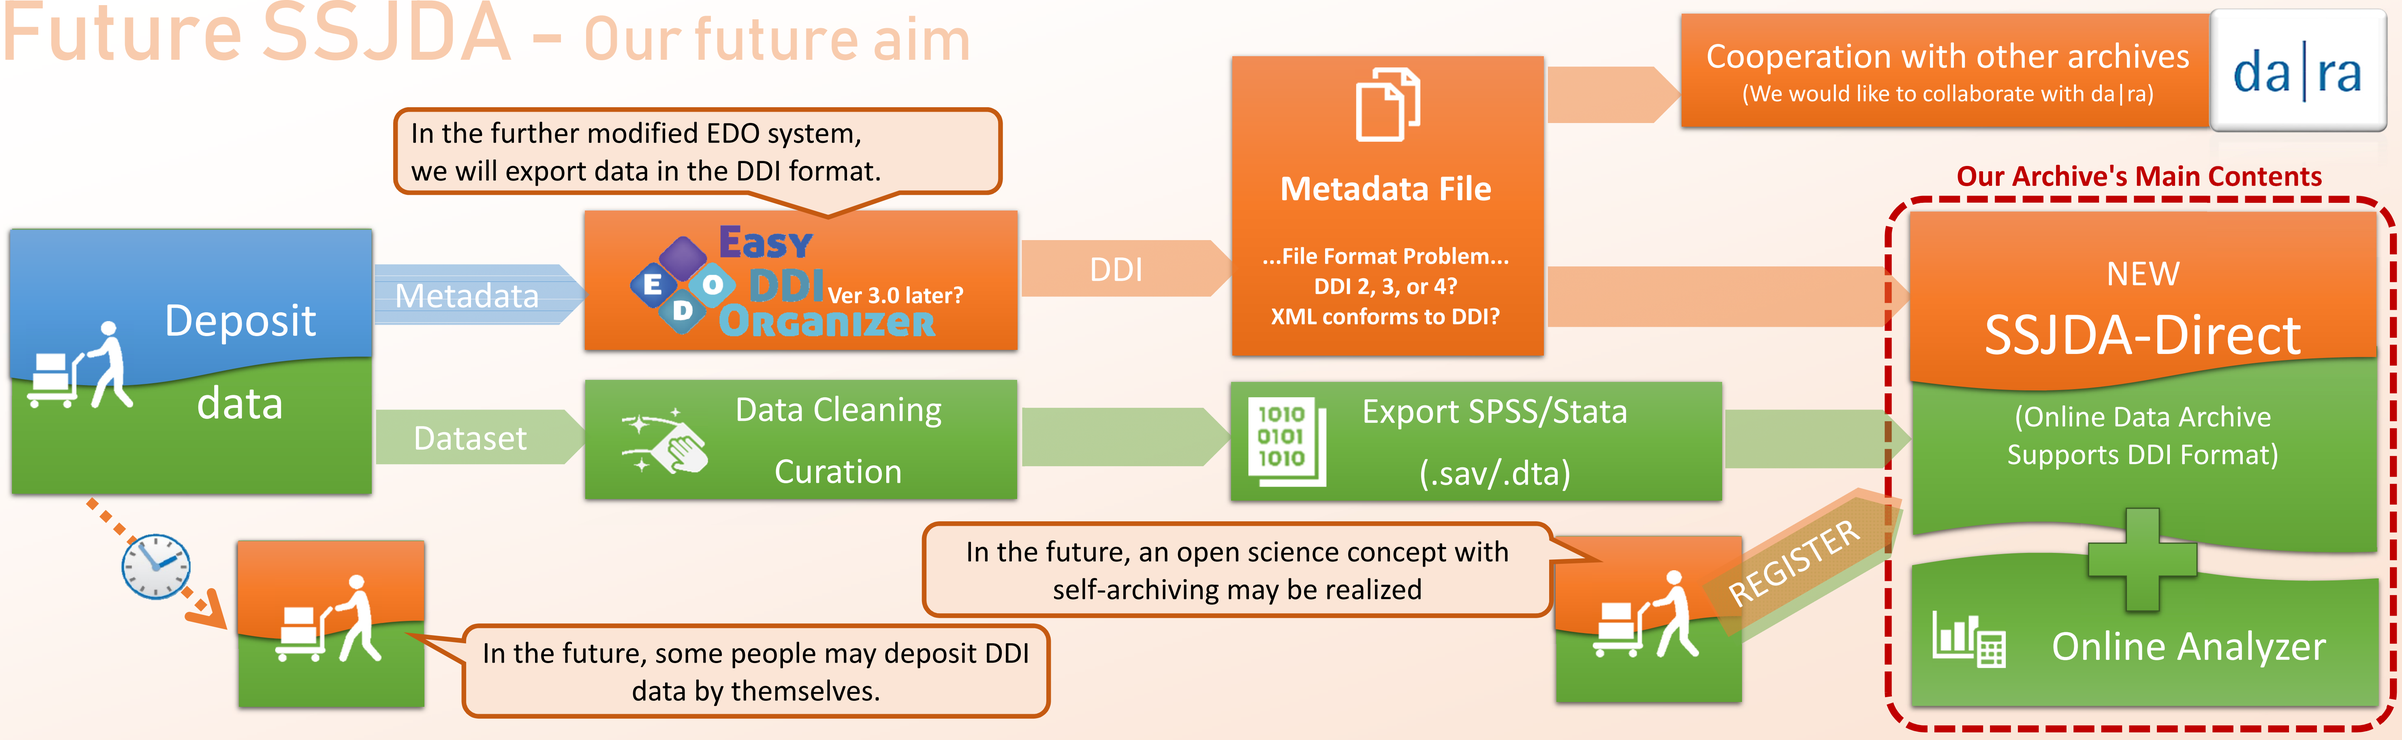


Current SSJDA – How it works



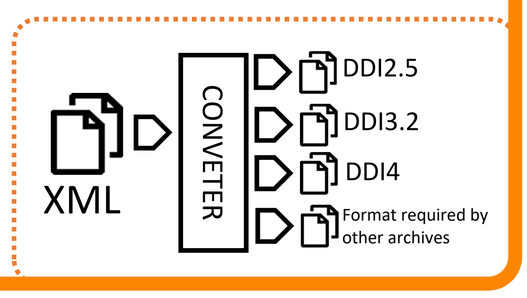
FUTURE SSJDA

Future SSJDA – Our future aim



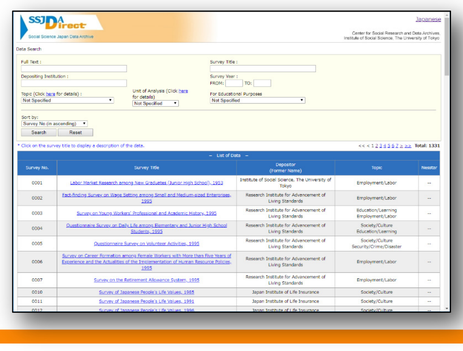
Need to Improve EDO

▷ EDO system requires a new user interface, so that the current staff responsible for "reshaping metadata" can seamlessly transition to input by EDO.
▷ With this upgrade, internal SSJDA metadata will be aggregated into one formatted file. Information in this file is referred to by SSJDA-Direct (archive system) and displayed to the user. Users can also download data in DDI or XML formats. OnlineAnalyzer can refer to this data and use it for cooperation with other archives. One problem is that it is difficult to select the correct DDI format.
▷ One solution is to use the same level as the information level we are currently inputting in split form for each element. This may enable conversion to many formats.
We expect that some people will deposit DDI data by themselves.



NEW SSJDA-Direct

▷ More than 10 years have elapsed since the introduction of "SSJDA-Direct," a metadata browsing and data download system. It was due for an upgrade.
▷ In currently planned large-scale remodeling, we are studying the realization of metadata management in DDI format by aligning information granularity in this format. Currently, information granularity mismatch is a problem.
▷ We will consider the mechanism of self-archiving to realize the open science concept. We aim for depositors to register metadata in the DDI format. Deposited metadata will be delivered to users without unnecessary information conversion.
▷ We will also improve function collaboration with Online Analyzer and the main archive content.
▷ This screenshot shows the current system. The new system will have a user-friendly interface. It will continue to use Apache and PHP; the database used may be MariaDB.



Cooperation with Other Archives

We think that it is necessary to declare "Hello World" as soon as possible. For cooperation using DDI, it is necessary to take the first step. The future plan presented in this poster is only a first step toward international collaboration.
Japan is currently considering launching an organization that grants DOI.
However, the Taiwanese SRDA is working on "da | ra" before metadata cooperation. SSJDA will also follow it.
