Research Data and Open Access

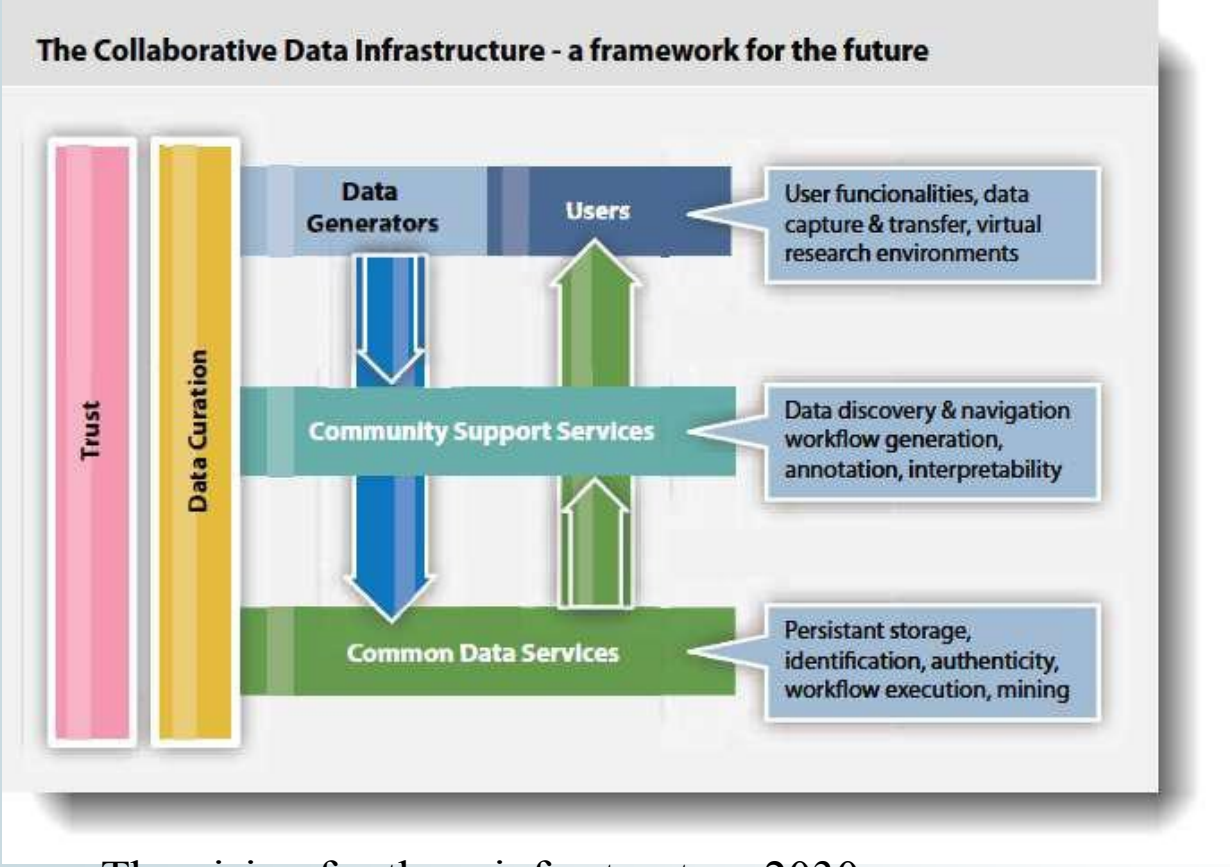
Nanna Floor Clausen
Danish Data Archive

With contributions from
Sofia Arvidsson, Swedish National Data Service

IASSIST 2011

- Open access
  - Definition
  - Danish recommendations
  - Swedish recommendations
- Project: research data and open access
- Role of DDI
- Co-operation and future development

EU- Riding the wave



The vision for the e-infrastructure 2030

Open Access in Denmark

- Final report from committee 2011
- Subscription to EU policy on scientific information
- The recommendations encompass all research institutions publicly funded
- 14 recommendations

Summary of recommendations

- Establishment of national open access policy
- One national portal for research publications
- Danish research publishers etc. should make a plan for a switch to open access
- Co-ordination of Danish and international efforts
- Establishment of long-term repository for publications
- National planning of free access to and long-term preservation of primary research data
- Danish membership of international fora for long-term preservation
- Conclusion: the gains of open access are substantial as are the cost reductions –depending on the investments

Open Access in Sweden

- Universities and HEI have signed Berlin Declaration 2004
- Both mandatory policies and recommendations
- Research council demands OA publishing when funding
- Number of OA journals increasing

- Openaccess.se promotes and fund projects
  - Transformed into a permanent programme
  - SwePub: a national search tool for published publications
  - Two projects on open access to data

- Researchers in general positive to OA
  - Though find that data need documentation before sharing

Pilot project on research data and open access

- Inspiration from open access movement
- Clarify the role of the research libraries regarding research data
- Partners

Questions to be answered

- What kind of possibilities and challenges are in this area?
- Which actions are relevant for the research libraries?
- Who are involved in research data? What is their role?
- How can the research libraries become relevant and interesting partners in the data area?
- How is the relationship between publications and data secured?
- What are the international experiences in this field?

What was done in the project?

- Best practice report
- Specific cases for each partner
- Test of persistent identifiers
- Input to future strategi for OA to data

The outcome

- Valuable best practice report and wiki
- Relationship between researchers and libraries
- Need of strategy for managing data
- Test of persistent identifiers
- Related to Swedish results:
  - Data sharing should be a scientific merit
  - Grants should include funds for preparing data for sharing and archiving
- Data closely related to research field

Future co-operation?

- Research libraries experienced in publications
- Data archives experienced in preserving and documenting quantitative surveys
- Combine the competences
- Use DDI as a starting point – inspiration
- Guidelines for research data from funding agencies needed
