How Many Jazz Musicians Are There?

Although national estimates of the number of jazz musicians are unavailable, the *Study of Jazz Artists 2001* estimated the number of jazz musicians in three metropolitan jazz hubs -- New York, San Francisco, and New Orleans -- at 33,003, 18,733, and 1,723, respectively.

Estimating how many jazz musicians there are in the United States is problematic, for a number of reasons. Beyond the question of who qualifies to be counted as a "jazz musician," sources of occupational data such as the decennial U.S. Census and the Current Population Survey do not collect information at a level of detail sufficient to determine how many jazz musicians there are. (See the CPANDA Quick Fact, "How many artists are there?" for more information.) In these sources, the occupational category that comes closest is "musicians and composers." But since the needs and situations of jazz musicians are likely to differ from those of musicians and composers in general, it is important for policy purposes to have information specific to the issues facing jazz musicians.

The Study of Jazz Artists 2001, was the first to collect detailed information specifically on the working and living situations of jazz musicians. Moreover, because of a unique methodological strategy employed by this study, it was also the first to provide meaningful estimates of the size of the jazz musician populations in three communities -- New York, San Francisco, and New Orleans. The number of jazz musicians in these three communities in 2001 was estimated at 33,003, 18,733, and 1,723, respectively. (The same sampling strategy was also used in Detroit, but yielded a sample size too small to reliably estimate the size of the jazz population in that city.) [Jeffri, Joan. 2003. *Changing the Beat: A Study of the*

Worklife of Jazz Musicians, Volume III: Respondent-Driven Sampling. NEA Research Division Report #43. Washington DC: National Endowment for the Arts.]

Download PowerPoint [ppt] download image [gif].

How These Estimates Were Obtained

Two separate sampling strategies were used in the study to determine the number of jazz musicians in each community. The first involved taking a sample of musicians belonging to the American Federation of Musicians (AFM) and determining what percentage of union musicians were jazz artists. The second employed an innovative sampling strategy called Respondent-Driven Sampling (RDS), which used the musicians themselves as "recruiters" of additional participants for the

used the musicians themselves as "recruiters" of additional participants for the study, and then determining what percentage of the recruited study participants were union members.

With those two pieces of information -- the percentage of union members in the AFM sample who are jazz musicians and the percentage of musicians in the RDS sample who are union members -- it is possible to estimate the total population of jazz musicians in a particular community. This method of estimating the size of hard-to-reach populations, such as jazz musicians, is called "capture-recapture," based on the fact that two complementary sampling strategies are being used to identify (or "capture") union musicians, one a sample of union members and the other a sample of jazz musicians.

The population estimates were further refined by taking into account differences in the sizes of the "networks" to which union and non-union musicians belong. In New York, for example, union musicians are likely to belong to larger networks of jazz musicians than are non-union musicians. That is, they tend to have more ties to other jazz musicians than do non-union musicians. The larger the size of a particular musician's network, the more likely that person is to be recruited to the study, which introduces a bias into the population estimate if it is not controlled for by proportionately weighting the data. Sufficient information on network sizes was gathered in both New York and San Francisco to allow such weights to be assigned to the data. The relatively smaller size of the New Orleans RDS sample, however, was insufficient to allow reliable weights to be calculated, so the population estimate for New Orleans is not quite as precise as the other two.

How Many Jazz Musicians Are There -- Definition of Terms

Definition of "Jazz Musicians"

In the 2002 study, Study of Jazz Artists 2001, a relatively inclusive definition was used to identify jazz musicians in each of the two samples drawn for this study. The first sample was drawn from the membership lists of the American Federation of Musicians (AFM) in New York, San Francisco, New Orleans, and Detroit. The second was a "respondent-driven sample" (RDS) of jazz musicians in each of the same four metropolitan areas.

In the AFM sample of union members, a respondent was considered a jazz musician if he or she answered "yes" to the question, "Do you ever play or sing jazz music?"

In the RDS sample of musicians, a respondent was considered a jazz musician if he or she answered "yes" to any of the following questions:

- Do you consider yourself a jazz musician?
- Did you earn more than 50 percent of your personal income in the last six months as a jazz musician or in jazz-related activities?
- Have you been engaged in your art/jazz more than 50 percent of the time during the last year?
- Have you performed in/with a jazz band at least 10 times in the last year?
- Have you performed with or without a jazz band for pay at least 10 times during the last year?

- Have you produced a documented body of work that is considered (self or externally) jazz? (Documented output = performances, compositions, collaborations, arrangements, recordings) [Jeffri, Joan. 2003. *Changing the Beat: A Study of the Worklife of Jazz Musicians, Volume III: Respondent-Driven Sampling*. NEA Research Division Report #43. Washington DC: National Endowment for the Arts.]

Respondent-Driven Sampling

Respondent-driven sampling (RDS) is a method of locating members of hard-to-reach populations that are difficult or costly to sample using traditional methodologies. Developed by Cornell University sociologist Douglas Heckathorn, RDS is a form of chain-referral sampling with checks and balances built in to overcome the biases usually associated with this method. A detailed description of the theory and mathematical underpinnings of this sampling method may be found in the article, "Finding the beat: Using respondent-driven sampling to study jazz musicians," by Douglas D. Heckathorn and Joan Jeffri [*Poetics* 28 (2001) 307-329].

Originally developed to locate injection drug users for HIV-prevention studies and later adapted to find members of such "hidden" populations as gay Latinos in Chicago and Vietnam draft resisters who left the U.S. for Canada, the Study of Jazz Artists 2001 represents the first time this sampling methodology has been used to study artists. According to the research report for the study:

> "RDS is a method based on peer recruitment. In each of the four metropolitan areas [New York, San Francisco, New Orleans, and Detroit], a city coordinator began the study by inviting six to eight jazz musicians to help start the project. These musicians were well connected in the community, not necessarily famous or very visible, but with many contacts since RDS depends on a high contact pattern of the subjects studied. Each of these musicians was interviewed [for the study]. Following the interview, each of these six to eight 'seeds' was given four coupons with which to recruit additional jazz musicians..."

"We paid the initial 'seeds' a modest $10 and for each coupon the seed gave out, another $15 each time one of the four coupons was redeemed. Any single jazz musician had the possibility to earn a total of $75. This limit on both coupons and payment incentives was to avoid over-representing one particular group of musicians to the exclusion of others." [Jeffri, Joan. 2003. *Changing the Beat: A Study of the Worklife of Jazz Musicians, Volume III: Respondent-Driven Sampling*. NEA Research Division Report #43. Washington DC: National Endowment for the Arts.]

How Many Jazz Musicians Are There -- Source of Data

The data used in this summary were taken from the Study of Jazz Artists 2001, conducted by the Research Center for Arts and Culture (http://www.tc.columbia.edu/centers/rcac/), under a cooperative agreement with the National Endowment for the Arts (http://www.arts.endow.gov/) and the San Francisco Study Center (http://www.studycenter.org/). Surveys were conducted in each of four metropolitan areas: New York, San Francisco, New Orleans, and Detroit. In each city, two surveys were conducted. The first was a conventional random sample of musicians belonging to the American Federation of Musicians (AFM). The second was conducted using "respondent-driven sampling" (RDS) among jazz musicians in each metropolitan area. (RDS is a new form of chain-referral sampling recently developed by Cornell University sociologist Douglas Heckathorn.) The RDS survey was conducted in order to locate jazz musicians who do not belong to the AFM union or other institutions that could be used to locate and identify them. [Jeffri, Joan. 2003. *Changing the Beat: A Study of the Worklife of Jazz Musicians, Volume III: Respondent-Driven Sampling*. NEA Research Division Report #43. Washington DC: National Endowment for the Arts.]

- Sources of Data

The 1997 Census of Service Industries (Economic Census) counted (at least) 26,392 arts & cultural organizations that were active at the end of 1997.

These organizations were broken out, as follows:

Arts & Cultural Organizations, 1997		
	#	%
Performing arts organizations	15,286	57.9%
Museums, historical sites, etc.	5,580	21.1%
Retail art dealers	5,526	20.9%
Total arts & cultural organizations	**26,392**	**100.0%**

- Performing Arts Organizations
- Museums, Historical Sites, and Similar Institutions
- Retail Art Dealers
- **Definition of Terms**
- Sources of Data

There are a number of difficulties associated with determining how many arts & cultural organizations there are in the United States:

1. What counts as an "arts organization" or a "cultural organization"?
2. For what sorts of organizations do data exist?
3. For what sorts of organizations do data not exist?

Defining "arts & cultural organizations"

Drawing a hard and fast dividing line between organizations that qualify as "arts or cultural organizations" and those that do not is not easy. Traditionally, the National Endowment for the Arts has collected and disseminated information about the following types of organizations:

Defining "arts & cultural organizations"

Drawing a hard and fast dividing line between organizations that qualify as "arts or cultural organizations" and those that do not is not easy. Traditionally, the National Endowment for the Arts has collected and disseminated information about the following types of organizations:

- Performing arts organizations
  - Producers of live theatrical productions
  - Dance groups and artists
  - Symphony orchestras, opera companies, and chamber music organizations
  - Other music groups and artists, such as:
    - Dance or stage bands/orchestras
    - Choral music groups
    - Jazz music groups or artists
  - Other performing arts organizations
- Museums, historical sites, and similar institutions
- Retail art dealers

Organizations that might qualify under some definitions as arts & cultural organizations but have been excluded from the totals reported here include:

- Establishments that provide both accommodations and recreational facilities, such as hunting and fishing camps and resort and casino hotels
- Restaurants and night clubs that provide live entertainment
- Motion picture theaters, libraries and archives, and publishers of newspapers, magazines, books, periodicals, and computer software
- Establishments using transportation equipment to provide recreational and entertainment services, such as those operating sightseeing tours

Note: For an excellent discussion of the difficulties involved in identifying and classifying arts organizations, see the 1996 report published by the Princeton University Center for Arts and Cultural Policy Studies, Data on Arts Organizations: A Review and Needs Assessment with Design Implications by Deborah Kaple et al.

Countable organizations

The primary means for collecting information about arts & cultural organizations is the Economic Census, conducted by U.S. Bureau of the Census every five years (in years ending in 2 and 7). The universe of organizations included in the Economic Census is largely based upon organizational data collected annually by the Internal Revenue Service and the Social Security Administration. But only certain types of organizations are required by law to file annual reports with the IRS or the SSA. Organizations that must file reports include:

- Taxable organizations (must file IRS business income tax form)
- Tax-exempt organizations with personnel designated as "employees" (must file FICA report with the SSA)
- Tax-exempt organizations with annual gross receipts of $25,000 or more (must file IRS informational report, Form 990)

Organizations that are difficult to count

There are a number of arts & cultural organizations that are not required to file annual reports with either the IRS or the Social Security Administration, and therefore may not be counted by the Economic Census. These include:

- Tax-exempt organizations with no personnel designated as "employees" (not required to file FICA report with the SSA)
- Tax-exempt organizations with annual gross receipts of less than $25,000 (not required to file IRS informational report, Form 990)

There is also another relatively common category of arts & cultural organization that does not get included in the count of arts & cultural organizations by the Economic Census. Some arts & cultural organizations are operated as subsidiaries of organizations that are classified by the Economic Census as belonging to a different industry. For example, an arts museum on a college campus would not be included in the total count of arts & cultural organizations. Rather, it would be counted as part of the universe of higher education organizations.

- **Sources of Data**

Economic Census (Census of Service Industries)

The primary source of data about the number of arts & cultural organizations in the United States is the Economic Census, conducted every five years by the U.S. Bureau of the Census (in years ending in 2 and 7). The Economic Census is actually a collection of censuses, among them the Census of Retail Trade, the Census of Wholesale Trade, the Census of Transportation, the Census of Manufactures, and others. Information about arts & cultural organizations comes from the Census of Service Industries.

Industries surveyed by the Economic Census are classified according to the North American Industry Classification System (NAICS). The NAICS is divided into 20 industrial "sectors," one of which is "Arts, Entertainment and Recreation" (assigned the two-digit code number "71"). The information reported here comes from the "Arts, Entertainment and Recreation" sector, except for information about "Retail Art Dealers," found in NAICS sector 45 ("Retail Trade") For more information on NAICS sectors, see NAICS Sectors and Their Coverage in the 1997 Economic Census, Table 3 [http://www.census.gov/epcd/www/guide.html].

National Assembly of State Arts Agencies and Arts Service Organizations

There are two other major sources of data on arts & cultural organizations, although neither collects data in such a way as to allow estimates to be made of the total number of arts & cultural organizations. These are:

- The National Standard for Arts Information Exchange, created by the National Assembly of State Arts Agencies (NASAA), and
- Periodic data collection efforts undertaken by various arts service organizations, such as the Theater Communications Group, the American Symphony Orchestra League, Opera America, Dance USA, and others.

State arts agencies use the National Standard for Arts Information Exchange to systematically collect data on all arts organizations that apply for state arts agency grants. These data are then collected and processed by NASAA. Since not all arts organizations apply for state arts agency grants, the National Standard database is not necessarily a comprehensive listing of arts organizations. But because many nonprofit arts organizations that are too small to file IRS 990 forms do apply for such grants, the National Standard database picks up some organizations not captured by the Economic Census.

Arts service organizations routinely collect financial and other data from their member organizations (e.g., theater companies, symphony orchestras, etc.), to allow members to compare themselves to other organizations that may be similar in budget or mission. But because the membership rosters of arts service organizations tend to consist primarily of the larger organizations in their fields, data collected from members do not provide a complete picture of their respective fields. Data collected by arts service organizations are also typically considered proprietary, and are usually only made available to member organizations, not to researchers or the general public.

Unified Database of Arts Organizations

Finally, it should be noted that an important new resource for information on arts & cultural organizations, called the Unified Database of Arts Organizations (UDAO) [http://nccs.urban.org/UDAO.htm], is being developed by the National Center for Charitable Statistics (NCCS) [http://NCCS.urban.org], in cooperation with the National Endowment for the Arts and the National Assembly of State Arts Agencies. The UDAO combines IRS data on arts organizations (e.g., from Form 990s) with records from state arts agency grant files, state arts agency mailing list files, information from national arts service organizations, and other sources, to create a comprehensive database of arts & cultural organizations. When the UDAO becomes available, it may allow for an even more complete enumeration of arts & cultural organizations than that provided by the Economic Census.

data archive

The Data Archive consists of machine-readable files containing numeric data of interest to researchers and others concerned with arts and cultural policy. The links below provide information on finding and using data in the Archive, analyzing data sets available in the Archive, depositing data with the Archive, and the latest data sets available on arts and cultural policy. All data sets in the Archive are available for simple statistical analysis online and may be downloaded for more extensive analyses.

Brooklyn Museum Art Controversy Survey 1999 [United States]: Summary

Study sponsored by: First Amendment Center
Study conducted by: Center for Survey Research and Analysis, University of Connecticut
Principal investigators: McGill, Lawrence T., First Amendment Center, and Dautrich, Kenneth, Center for Survey Research and Analysis, University of Connecticut

Abstract

This national survey collected data on Americans' attitudes concerning freedom of expression issues arising from the exhibit of a controversial art show at the Brooklyn Museum in the fall of 1999. Controversy about the show, titled "Sensations," centered on a painting of the Virgin Mary by British artist Chris Ofili that incorporated elephant dung and cut outs of pornographic images into its design. The survey included questions about awareness of the controversy, attitudes toward the public display of potentially offensive art, attitudes toward government censorship of art, and attitudes toward public funding of museums that display controversial art.

Methodology

A total of 1,005 computer-aided telephone interviews were conducted with a sample of American adults between September 29, 1999 and October 3, 1999. There are 43 variables in the data set.

THE GENERAL SOCIAL SURVEY, 1998

The General Social Surveys (GSS) have been conducted by the National Opinion Research Center annually since 1972 except for the years 1979, 1981, and 1992 (a supplement was added in 1992), and biennially beginning in 1994. The GSS are designed as part of a program of social indicator research, replicating questionnaire items and wording in order to facilitate time-trend studies. Items in the 1998 GSS include special modules on religion (with items measuring giving, volunteering, religious self-identification, religious schooling, congregational affiliation, and spiritualism), culture, job experiences, inter-racial friendships, national security, medical care, medical ethics, and the social security system.

DESCRIPTION OF STUDY

DATA FILE
Variables: 858
Cases: 2,832
Weight Variables: 92, 855, 858

DATA COLLECTION
Date Collected: February, March, and April of 1998

Funded by
National Science Foundation, National Opinion Research Center (NORC), The Lilly Endowment, Inc., the Fetzer Institute, Academy Sinica, the Lilly Corporation, the National Institutes of Mental Health, the Office of Naval Research, the American Association of Retired Persons, and the Luce Foundation.

Collection Procedures
Survey data was taken utilizing personal interviews.

Sampling Procedures
The 1998 GSS is a national probability sample that follows a biennial, double sample design adopted in 1994 (this biennial, split-sample design was

research guides

CPANDA staff have compiled guides to available research data on arts and cultural policy issues, in the areas of artists, audiences, arts and cultural organizations, and support for the arts. Here, we list data sets and data sources that we have identified to date. If you know of data sets or data sources that should be added to these inventories, please contact us at cpanda@princeton.edu and let us know, so we can improve the comprehensiveness of these listings.

Audiences: Overview of Available Data

Table of Contents

- Survey of Public Participation in the Arts
- Other Significant Studies of Audiences
- Data from Arts Organizations and Arts Service Organizations
- Commercial Data
- Consumer Spending Data
- For More Information

There are several key sources of data on audiences and arts participation. The most comprehensive is the Survey of Public Participation in the Arts conducted roughly every five years (since 1982) by the National Endowment for the Arts. A number of other national, regional, statewide, and local surveys have also contained questions on arts and cultural participation. In addition, individual arts and cultural organizations and arts service organizations may periodically collect data on the numbers of people participating in their programs (or in the programs of their member organizations). Audience data for commercial arts and cultural activities are collected by a wide variety of organizations, many of which charge fees for access to the data.

Many studies that focus on arts participation also collect data on public attitudes toward the arts. Studies that focus exclusively or primarily on public attitudes toward the arts will be listed in the forthcoming CPANDA Overview of Available Data on Support for the Arts.

Survey of Public Participation in the Arts

The Survey of Public Participation in the Arts (SPPA), generally considered the most comprehensive and reliable source of data on arts participation in the United States, has been conducted roughly every five years (since 1982) by the Research Division of the National Endowment for the Arts (http://www.nea.gov). The survey asks questions concerning respondents' attendance at live arts events, their participation in the arts through broadcast and recorded media, and the types of artistic activities they engage in personally. Arts and cultural activities covered in the survey include jazz performances, classical music performances, opera, musical plays, non-musical plays, ballet, dance performances other than ballet, visiting art museums, visiting historical parks, reading literature, and attending arts and crafts fairs. The 1982, 1985 and 1992 surveys were conducted by the Bureau of the Census, as a supplement to a larger national survey, the National Crime Survey (NCS). The 1997 survey was conducted by Westat as a stand-alone survey. All four SPPA data sets are available through CPANDA. Results from the 2002 SPPA will be available sometime in 2003.

The NEA also conducted a series of local surveys of public participation in the arts in 1992. These data sets will soon be available through CPANDA.

Other Significant Studies of Audiences

CPANDA has identified a number of other important data sets on audiences created over the past 30 years, some of which are available through the Archive. For those data sets available through CPANDA, we have provided a direct link to the study's summary page in CPANDA. For data sets available elsewhere, links have been provided to the relevant web sites.

National Studies: In addition to the Surveys of Public Participation in the Arts conducted by the NEA, other significant national-level studies on audiences conducted over the past 30 years include:

- General Social Survey: Culture Module (2002) [http://www.ropercenter.uconn.edu/gss.html]
- Classical Music Consumer Segmentation Study (2001)
- General Social Survey: Internet Module (2000) [http://www.ropercenter.uconn.edu/gss.html]
- General Social Survey: Culture Module (1998)
- General Social Survey: Culture Module (1993)
- Americans and the Arts I - VII (1972 - 1996) [http://www.irss.unc.edu/data_archive/home.asp]

Regional and State Studies: Significant regional or state-level studies on audiences conducted over the past 30 years are listed below. All of these data sets are available through the Odum Institute Data Archive at the University of North Carolina [http://www.irss.unc.edu/data_archive/home.asp].

- Southern Focus Poll (Spring, 1994)
- Maryland Poll (1993)
- South Carolina State Survey (April, 1991)
- Kentucky Poll (1989)
- Maryland Poll (1989)

Data from Arts Organizations and Arts Service Organizations

Many arts organizations and arts service organizations periodically collect audience data, and may make it available to researchers on a case-by-case basis. It is important to keep in mind, however, that audience data collected by such organizations is often gathered for purposes unrelated to research, which may make it unsuitable for analyses outside of its original scope. For a list of some of the major arts service organizations, see Arts and Cultural Policy Resources: Nonprofit Organizations.

Table of Contents

Commercial Data

Audience data for commercial arts and cultural activities, such as motion pictures, Broadway theater, recorded music, and television, are collected by a wide variety of organizations, many of which charge fees for access to the data. For a list of some of the major organizations that collect such data, see Arts and Cultural Policy Resources: Commercial-Sector Organizations.

Consumer Spending Data

Data on total consumer spending on arts and cultural activities (broadly categorized) are available through the Bureau of Economic Analysis (BEA). Estimates of total consumer expenditures are derived from the BEA's National Income and Product Accounts (NIPA). Annualized data are available from 1929 to the present. To access information relevant to arts and cultural activities, go to http://www.bea.gov/bea/dn/nipaweb/SelectTable.asp?Selected=N and select Table 2.4, Personal Consumption Expenditures by Type of Expenditure. Users of these data should be aware that historical NIPA estimates are annually revised. A guide to using NIPA data may be found at http://www.bea.doc.gov/bea/an/nipaguid.pdf.

For More Information

There are several good sources for additional information about research on audiences:

The Center for Arts and Cultural Policy Studies at Princeton University has compiled an inventory of studies conducted since the 1970s on public participation in the arts and public attitudes toward the arts. The list includes only studies that attempted to generalize from a sample to a larger population. Each entry indicates, insofar as possible from available materials, the study investigator, the population studied, sampling procedures, number of respondents and response rates, areas of questioning, and publications based on the study. Information about many of the data sets not currently available through CPANDA is available in this publication. [Pettit, Becky, with forward by Paul DiMaggio and Stanley Katz. 1997. *Resources for Studying Public Participation in the Arts: An Inventory and Review of Available Survey Data on North Americans' Participation in and Attitudes towards the Arts* Working Paper No. 2. Princeton, NJ: Center for Arts and Cultural Policy Studies. (http://www.princeton.edu/~artspol/wrkpap02.html)]

The National Endowment for the Arts (NEA) has issued a series of reports on its Surveys of Public Participation in the Arts (SPPA), since the first one was conducted in 1982. The NEA has also conducted a series of analyses of Bureau of Economic Analysis data on consumer spending on the arts since the early 1980s. Brief reports on both the SPPA studies and the BEA data may be found at http://www.arts.gov/pub/ResearchNotes.html#Audiences. Longer reports on the SPPA studies may be found at http://www.arts.gov/pub/ResearchReports.html#Audiences.

RAND has also produced a *Guide to the Literature on Participation in the Arts*, available at http://www.rand.org/publications/DRU/DRU2308/ [McCarthy, Kevin F., Elizabeth H. Ondaatje, Laura Zakaras. 2001. *Guide to the Literature on Participation in the Arts*. Santa Monica, CA: RAND].
